Data Management

Organising Data in the Cloud is No Mean Feat

Data management is a complex process, made tougher due to the humongous amount of data being generated each day. Databases were developed to make sense of this data but these need to evolve continuously with the increasing demands being made on them. Following a few best practices will also help to manage data well.. [Read more on page.....25](#)

The Power of Proxmox Backup Server with Proxmox VE

The Proxmox Backup Server is an open source backup software project that supports virtual machines, containers, and physical hosts. Based on the Debian Linux distribution, it comes with out-of-the-box ZFS support. We look at its key features and benefits.

AI Databases: Ensuring the Quality of LLMs in Chatbots

Digital transformation initiatives and the need for 24/7 customer support have been instrumental in propelling the adoption of AI chatbots. But these bots need authentic and well-developed large language models (LLMs) to work efficiently. LLMs, in turn, are dependent on AI databases that are built on data that is consistent, complete and accurate. There are quite a few open source and free AI databases to choose from.
