

Figure 1: Proxmox Backup Server dashboard

recover specific data without restoring entire backups, saving time and resources.

Flexible retention policies

The Proxmox Backup Server provides flexible retention policies that can be scheduled from the server or triggered manually from the client. The built-in Prune Simulator allows users to visualise and fine-tune retention settings, ensuring that backups are intelligently thinned out over time. This flexibility helps manage storage space effectively while maintaining the necessary historical backups for compliance and recovery purposes.

Enterprise-grade features

Designed with enterprise-grade features to meet the needs of large-scale IT environments, including two factor authentication, PBS supports secure backup and storage on-premises and remotely, with no vendor lock-in. For advanced users, the command line interface (CLI) and REST API offer powerful tools for integrating and automating backup processes. The solution is written in Rust, offering performance, speed, and memory efficiency. Additionally, PBS supports tape backup, enabling long-term archival and reliable data recovery options.

User-friendly management interface

Managing Proxmox Backup Server is straightforward, thanks to its integrated web-based user interface. The GUI provides comprehensive management capabilities, including datastore organisation, performance monitoring, backup task management, and usage statistics. The interface also supports the configuration of network settings, user permissions, remote stores, and subscriptions, making it accessible and manageable for IT experts and novices alike.

Proxmox Backup Server, when used with Proxmox VE, provides a robust, secure, and efficient backup solution for IT managers. Its seamless integration, efficient data handling, advanced security features, and user-friendly management make it an invaluable tool for protecting virtual environments. By leveraging the powerful capabilities of PBS, IT managers can ensure the safety and availability of critical data with minimal effort and maximum reliability. **END** 🐧
