

Steps to deploy LokiStack on OpenShift

To successfully deploy a running LokiStack on OpenShift, follow these three essential steps.

- Install the Loki Operator from the OpenShift console.
- Create an object storage by generating

the OpenShift console. Begin by navigating to the 'Operators' section and accessing the 'Operator Hub'. Search for the Loki Operator and proceed with the installation process.

a secret. This secret can be configured for various object storage providers such as AWS, GCP, or Minio. Ensure the secret is correctly configured to enable Loki to store logs securely.
