

Figure 14: Application logs displayed on the dashboard

comprehensive monitoring and troubleshooting.

Monitoring Kubernetes clusters

Scenario: A company operates multiple Kubernetes clusters on s390x infrastructure, each hosting critical workloads. It seeks a robust log management solution capable of providing real-time insights into cluster health and performance.

Solution: Leveraging Loki Operator, the organisation deploys Loki alongside Prometheus for comprehensive cluster monitoring. With Loki's log aggregation capabilities, it gains visibility into cluster-wide events, resource utilisation trends, and application behaviour, empowering proactive management and optimisation of Kubernetes clusters.

Troubleshooting and debugging

Scenario: Members of a development team encounter intermittent errors within their application running on s390x architecture, hindering productivity and user experience. They require an efficient mechanism for identifying and resolving issues in real-time.

Solution: By integrating Loki into their logging infrastructure, the team members gain access to a powerful query language and dynamic log

indexing capabilities. This enables them to conduct targeted searches, filter logs based on specific criteria, and correlate events across distributed systems, expediting troubleshooting and debugging processes.

Alerting and notification

Scenario: An e-commerce platform operating on s390x infrastructure experiences periodic spikes in traffic, potentially signalling performance degradation or service interruptions. The operations team aims to implement proactive alerting mechanisms to mitigate potential issues.

facilitating prompt intervention and service restoration.

Whether centralising logs for streamlined monitoring, troubleshooting application issues, or enhancing security posture, Loki serves as a versatile tool for addressing diverse operational challenges. Organisations must try and unlock the full potential of Loki to elevate their log management practices to new heights of efficiency and effectiveness.

As stated at the beginning, the subsequent segment of this article series will involve deploying various applications and analysing logging outcomes within the dashboard. **END**
