

What's new in Penpot 2.0?

Penpot 2.0, a web-based open source design tool, has been launched as a significant update, featuring new support for CSS grid layouts. This addition enables designers to craft intuitive layouts with precise control, while also producing code that is friendly for developers to work with.

The user interface has been comprehensively revamped with a focus on accessibility. Changes include relocating the toolbar to the top of the interface and introducing dedicated panels for various options, such as components and the newly implemented grid layout feature, enhancing both functionality and user experience.

Penpot 2.0 introduces enhancements in iconography and typography, collapsible menus for streamlined navigation, improved reading contrast for better readability, and enhanced keyboard navigation for improved accessibility.

Additionally, this release includes the ability to generate HTML markup for existing SVG and CSS styles, along with an “image as fill” option to maintain image ratios seamlessly.

During the launch of this version, Pablo Ruiz-Múzquiz, CEO of Penpot, emphasised these advancements as pivotal steps forward.

enhancing the OAI CU/DU stack and related software, like the OAI FlexRIC. This collaboration is deemed timely and critical for meeting the evolving needs of the 5G and 6G research and industrial communities, enhancing both development and implementation of open RAN solutions.

Andreas Tille elected as Debian project leader

In April 2024, the Debian team held the project’s annual election for the position of project leader. The results of the vote have been published with Andreas Tille winning the election and being appointed as the Debian project leader. The voting

was done by over one-third of the Debian developers from 6th to 19th April. Tille began his one-year term on 21st April this year. The last leader, Jonathan Carter, had held office for four years.

Andreas Tille has been a Debian package maintainer for over 25 years and is the author of the project, Debian Med, aimed at optimising the distribution to solve problems related to medicine and biological research. In addition to development, Andreas also provides mentoring, teaching newcomers who want to join development. He is a Debian developer with the most uploads, and has been a member of various language teams in Debian. The teams he has been most involved with are the Debian Python team and the R Packaging team.

Meta’s Llama 3 and the rise of open source LLMs

Meta has recently unveiled Llama 3, a robust open source large language model. The tech giant perceives an opportunity for their new startup, Sizzle, to utilise an AI model of similar potency to OpenAI’s GPT-4, but with reduced operational costs and a more transparent framework for external scrutiny and modification.

The introduction of Llama 3 represents a significant moment for Pesenti and Sizzle. Currently utilising GPT-4 and a range of other AI models, both proprietary and open, Sizzle’s engineers are exploring the possibility of incorporating Llama 3
