

GitHub Copilot Workspace is designed to be mobile-compatible, acknowledging that ideas and development can occur anywhere, from desktops to mobile devices. This flexibility supports developers in maintaining productivity regardless of location. With this launch, the company aims to make programming more accessible and intuitive. This initiative not only supports professional developers in enhancing their efficiency and creativity but also opens opportunities for hobbyists and newcomers to the field.

The CEO of GitHub, Thomas Dohmke, emphasised the transformative impact of generative AI on software development over the past two years. The introduction of GitHub Copilot in 2022 as an autocomplete tool marked the beginning of this journey, reportedly increasing developer productivity by up to 55%. Following its success, GitHub launched Copilot Chat in 2023 to facilitate real-time coding, debugging, and testing through natural language interactions.

Red Hat, Inc. announces release of Red Hat Enterprise Linux 9.4

Red Hat, Inc. has released Red Hat Enterprise Linux 9.4, the most recent update of its premier enterprise Linux platform. This version introduces a suite of new and improved features designed to simplify the management of hybrid cloud infrastructure in an AI-driven era. These enhancements include advanced management and automation tools and proactive support for creating standard operating environments (SOEs) for distributed systems.

“Linux is no longer just about the kernel or the command line, it’s about making the platform more accessible, more manageable and more responsive, especially as technology organisations scale across the hybrid cloud. Whether exploring the potential of AI workloads or simply trying to optimise existing resources, the latest release of Red Hat Enterprise Linux helps limit complexity and improve efficiency, while making the most of existing skills and tools,” said Gunnar Hellekson, vice president and general manager, Red Hat Enterprise Linux, Red Hat.

Red Hat Enterprise Linux 9.4 brings a wide range of new and enhanced capabilities to better manage the complexity of hybrid cloud computing in an increasingly AI-centric world, including refined management and automation, and proactive support in building SOEs for distributed systems.

On the security front, Keylime verifier and registrar containers are available. You can now configure Keylime server components, the verifier and registrar, as containers. When configured to run inside a container, the Keylime registrar monitors the tenant

systems from the container without any binaries on the host. The container deployment provides better isolation, modularity, and reproducibility of Keylime components.

With this update, the glusterd SELinux module is maintained in the separate glusterfs-selinux package. The module is therefore no longer part of the selinux-policy package.

Red Hat Enterprise Linux 9.4 is now available for existing Red Hat customers via the Red Hat Customer Portal. Red Hat Enterprise Linux 8.10 will be available in the coming weeks via the Customer Portal as well.

Ubuntu 24.04 released with performance engineering tools pre-loaded

Canonical has announced the release of Ubuntu 24.04 LTS, code named ‘Noble Numbat’, available to download and install from <https://ubuntu.com/download>.

Ubuntu 24.04 LTS builds on the advancements of the last three interim releases as well as the contributions of open source developers from around the world to ensure a secure, optimised and forward-looking platform.

“Ubuntu 24.04 LTS takes a bold step into performance engineering and confidential computing to deliver an enterprise-grade innovation platform, supported for at least 12 years,” said Mark Shuttleworth, CEO of Canonical. “For developers we are delighted to announce TCK certified Java, an LTS for .NET and the latest Rust toolchain.”

With the new release, performance engineering tools are pre-enabled and pre-loaded. Ubuntu 24.04 LTS delivers the latest Linux 6.8 kernel with improved syscall performance, nested KVM support on ppc64el, and access to the newly landed bcache file system. In addition to upstream improvements, Ubuntu 24.04 LTS has merged low-latency kernel features into the default kernel, reducing kernel task scheduling delays.
