

contributions. If open source projects can achieve goals more effectively and efficiently, it makes financial sense to participate, ensuring a balance that maximises both financial and innovation benefits.

Q. What do you seek in the Open Source India conference?

Our primary goal at the Open Source India (OSI) conference was to interact with the community and share our learnings and experiences regarding operational methods and technologies. The focus of our sessions wasn't on promoting Salesforce as a product or a company. For instance, the talk I delivered was centred around technology itself, independent

of Salesforce's offerings. The main objective was to focus on how things are built and how companies might want to approach building them. Personally, the reason for giving this talk is to understand the challenges others are facing and how they are addressing these issues. This insight is valuable as it can be applied back in our own work, especially when dealing with similar problems. Conferences like OSI provide an opportunity to gain a broader perspective on problem-solving in the open source realm, which can be beneficial for personal and professional growth.

Q. What major technologies is Salesforce currently looking at?

At Salesforce, the scale of our operations is extensive. Our greatest strength is our flexibility in technology use. We do not impose restrictions on using a specific tech stack, programming language, or method of working. This autonomy allows each team, including mine, to innovate and experiment, but comes with the responsibility of staying within certain guardrails. I can introduce new technologies, get them approved, and start using them in our projects. We are also actively developing new technologies.

Importantly, we contribute back to the community, sharing our advancements and learnings, fostering innovation within Salesforce, and supporting the broader tech community's growth and development. **END** 🐧
