

4. **How governance compares:** Let's now compare the policies, procedures, and controls that guide the secure and compliant use of cloud services across the organisation, ensuring alignment with business objectives and regulatory requirements.

Cloud security strategy	Aspect	Enterprise cloud security strategy
This strategy aligns with CSP or industry standards, utilising established controls and policies for cloud compliance and security. Evaluates CSP-provided security features and complies with industry regulations to enhance security posture and mitigate cloud-related risks.	Governance	Develops and enforces a comprehensive cloud governance framework designed to the organisation's unique needs, aiming for consistency, compliance, and security across all layers of the enterprise platform. This involves integrating governance measures seamlessly into existing organisational policies and infrastructure, ensuring alignment with overarching security objectives, and promoting a unified approach to security management.
The absence of a convergent approach in cloud security governance may result in oversight of grey areas, leading to compliance gaps and heightened risks. Prompt, comprehensive action is essential to mitigate these risks and address regulatory concerns.		The enterprise cloud security governance strategy enforces consistent governance policies across all cloud services and on-premises resources, extending beyond individual platforms. This ensures comprehensive protection across diverse environments.

5. **Comparing centralised policy management:** Here's a comparison of the practice of centrally defining, implementing, and enforcing security policies and controls for cloud-based environments.

Cloud security strategy	Aspect	Enterprise cloud security strategy
This strategy utilises policy management recommendations provided directly by the CSP, designed to manage security policies within the specific cloud environment.	Centralised policy management	Develops customised policies to meet the enterprise security objectives that adopt centralised policy management, enabling consistent enforcement of security policies across the enterprise cloud landscape.
CSP-centric policy management can result in fragmented security measures across enterprises, making it challenging to ensure comprehensive security coverage, enforce consistent standards, and maintain regulatory compliance.		Designs uniform enterprise security baselines across cloud services and on-premises resources, considering interdependencies for cohesive security measures and enforcement. Aligns policies, controls, and practices to establish a unified security posture spanning both environments. Addressing interdependencies enhances risk mitigation and maintains consistency in security measures.

6. **Risk management comparison:** This compares the process of identifying, assessing, and mitigating risks associated with cloud adoption and usage.

Cloud security strategy	Aspect	Enterprise cloud security strategy
Focuses on addressing threats identified by enterprise risk management through standalone mitigation strategies, lacking a cohesive approach aligned with enterprise-wide security objectives.	Risk management	Implements comprehensive risk management across cloud, on-premises and third-party vendors, for holistic risk mitigation.
Prioritises risk management within the confines of the cloud provider's capabilities and recommendations, focusing on mitigating risks specific to the cloud environment without broader alignment with the organisation's overall risk appetite or overarching risk management framework.		Aligns risk management with the organisation's overall risk appetite, integrating it into the overarching risk management framework to ensure consistency and alignment with enterprise objectives.
