

Cloud security strategy	Aspect	Enterprise cloud security strategy
Responsibilities are often delineated between the cloud service provider (CSP) and the cloud customer, leading to potential ambiguity and accountability gaps.	Stakeholder and responsibility	Assumes responsibility for addressing grey areas by proactively designing security strategies through people, processes, or technology to mitigate any gaps in security. This involves aligning security measures with business objectives, ensuring compliance with regulatory requirements, and addressing the specific security needs of different business units.
The involvement of multiple stakeholders in defining and maintaining security strategies can lead to ambiguity, miscommunication, and delays in decision-making. This lack of clarity and coordination among stakeholders may compromise the effectiveness of security measures and incident response efforts within the cloud environment.		Organisational responsibility extends to implementing and managing security measures across the enterprise IT landscape, requiring collaboration and alignment of the entire organisation with the enterprise cloud security team.

10. Operations: Let's compare the ongoing activities and practices involved in managing, monitoring, and maintaining cloud security, including regular assessments, updates, and improvements to security measures and processes.

Depends on CSP-provided incident response frameworks to enhance operational excellence and minimise risks by leveraging CSP resources and expertise efficiently.	Operations	Centralising incident coordination across the enterprise optimises operational efficiency and reduces response times. This approach ensures consistent response efforts, swiftly addressing security incidents, and minimising disruptions to business operations.
The strategy prioritises security operations within the cloud environment, customising measures to address cloud-specific risks and optimise operational efficiency. This targeted approach enables proactive identification and mitigation of cloud-related security risks		The strategy integrates security operations with broader organisational processes, fostering collaboration and alignment across departments. This approach promotes operational resilience, adaptability to threats, and proactive risk management aligned with business objectives and compliance requirements.

To conclude, while a 'cloud security strategy' may appear adequate during the early stages of cloud adoption, it may become insufficient as businesses evolve. This approach could pose significant challenges in providing unified protection and complying with external regulatory requirements.

An enterprise cloud security governance strategy addresses the complex intersection of various layers of cloud infrastructure by implementing multifaceted security controls through a cohesive framework. This strategy adopts an inclusive approach to incorporate every aspect of enterprise security, covering various layers of enterprise cloud, and adding layered defence-in-depth protection across the enterprise infrastructure, effectively addressing security loopholes.

Security needs to be intricately woven into the fabric of operations. In the next article in this series, we will delve into how an enterprise cloud governance strategy must be defined,

with security at its core, to establish a well-rounded security posture for enterprises. **END** 🐧
