

Red Hat extends mission-critical automation for customers across the hybrid cloud

Latest Garuda Linux release is code named 'Bird of Prey'

The Garuda Linux team has announced the launch of the latest version of its distro, code named 'Bird of Prey'. This update introduces a fully integrated and refined Plasma 6.0 desktop environment, focusing on significant usability enhancements and the continuous rolling-release updates from both the Garuda Team and Arch Linux.

Key to this release is the adoption of BTRFS, a modern Copy-on-Write (CoW) file system for Linux that emphasises advanced features, fault tolerance, repair, and straightforward management. The distribution incorporates automatic snapshots by default, ensuring systems remain bootable even after problematic updates. These snapshots are backed before each update and can be accessed directly from the GRUB menu.

The release also includes a suite of GUI tools designed to simplify system maintenance and configuration. Tools like the Garuda Assistant help users configure and perform common system tasks, while Snapper-Tools, a proprietary snapper management GUI, streamlines snapshot management.

The distribution leverages Chaotic-AUR as an additional repository, providing a vast selection of precompiled software, including emulators, kernels, games, themes, and over 3800 other packages right out of the box.

Red Hat has announced the expansion of its mission-critical automation offerings for customers operating across hybrid cloud environments. The focus is on highlighting how organisations worldwide leverage the Red Hat Ansible Automation Platform to streamline cloud-native operations, foster a comprehensive automation culture, and effectively tackle complex challenges.

“We’re pleased to have Ansible Automation Platform serve as the linchpin for these technology efforts, providing the mission-critical element of any effective modern IT strategy,” said Sathish Balakrishnan, vice president and general manager of Ansible at Red Hat.

Numerous enterprises have effectively integrated the Ansible Automation Platform into their operations, demonstrating its versatility and impact across various industries.

MAPFRE, a global insurance firm headquartered in Madrid, achieved significant improvements in time to market, cost efficiency, and sustainability by leveraging the Ansible Automation Platform. It serves as a tool to mitigate issues stemming from human error, which accounts for over 50% of incidents, enhancing overall resilience.

Navy Federal Credit Union, the world’s largest credit union, utilised the Ansible Automation Platform to drive cultural change and accelerate provisioning time to value from 11 days to just 1 day. Additionally, the platform provided a unified format for sharing code, ideas, and workflows, fostering collaboration across teams despite differences in programming languages.

TD Bank adopted an automation-first mindset to enhance platform delivery capabilities, strategically architecting its Ansible environment. Through this
