

LibreELEC 12.0 with Kodi (Omega) v21.0 released

The LibreELEC development team has announced the release of LibreELEC 12.0.0, a major new update of the project's multi-platform Linux distribution featuring the Kodi media centre. The new release ships with Linux kernel 6.6.28 and Kodi 21.0.

This version marks a significant update, as many devices, including the Raspberry Pi 4 and 5, have been transitioned to 64-bit architectures. Users updating from LibreELEC 11 on devices using Widevine DRM—a requirement for copy-protected video add-ons like Prime Video and Netflix—will need to reinstall Widevine DRM due to these architecture changes.

Installations from LibreELEC 11.0 will not automatically update to the new version; however, they can be updated manually. Additionally, any installations from versions earlier than LibreELEC 10.0 will require a clean installation because of the changes to Python 3 that have been in place since Kodi 19.

The Generic image continues to use the GBM/V4L2 graphics stack, consistent with the company's approach to ARM devices.

approach, it automated the standardisation of over 10,000 network devices against new-state standards, leading to improved software deployment, compliance, and configuration management.

These success stories underscore the transformative potential of automation platforms in driving business innovation and operational efficiency.

VIavi joins the OpenAirInterface Software Alliance

Viavi Solutions Inc. has announced its new role as a member of the Strategic Board of the OpenAirInterface Software Alliance (OSA). This collaboration

integrates a professional test equipment provider into OSA's board and strengthens the connection between the O-RAN ALLIANCE and other stakeholders in the open RAN ecosystem, marking a significant progression in open source telecommunications initiatives.

OpenAirInterface, being at the forefront of open source software development for 4G and 5G networks, is crucial in driving multi-vendor open RAN solutions. It facilitates interoperability through its O-CU and O-DU software, which operates in conjunction with O-RUs from various industrial partners. The involvement of VIavi, known for its rigorous testing methodologies, is set to enhance the development and quality of these open source components significantly.

VIavi's active participation in the 3GPP, O-RAN ALLIANCE, and TIP highlights its commitment to the advancement of network technologies. Its contributions to global Open RAN PlugFests and its comprehensive testing suite for network validation and assurance positions it as an invaluable asset in the field. By joining OSA's board, the company not only brings its testing capabilities to the table but also aligns perfectly with the alliance's mission to nurture innovation and collaboration in the development of next-generation wireless technologies. This partnership promises to expedite the adoption of open source solutions, aiming to enhance the agility, scalability, and cost-efficiency of deploying wireless infrastructures globally.

Dr Ian Wong, director of RF and wireless architecture at VIavi, said: "We are committed to pushing the boundaries of open source software for future network technologies and see our collaboration with OSA as a critical step towards innovative advancements, particularly in the fields of AI/ML and network disaggregation."

OSA president Raymond Knopp also commented on the synergy, noting the essential role of continuous high-quality testing provided by VIavi in
