

to ensure they operate responsibly and transparently.

Personalisation: AI agents possess the capability to retain individual preferences, enabling personalised interactions. They also have the capacity to store and utilise knowledge.

Integration capabilities: They integrate with existing systems and processes, enhancing overall organisational efficiency and effectiveness.

How to go about adopting AI agents in your business

Organisations must take a few critical steps to ensure successful deployment and integration of AI agents into their business.

Governance: Establish clear governance frameworks and compliance protocols to manage the deployment of AI agent systems. Define the policies for data privacy, security, and ethical use of AI.

Identify business use cases: Identify the business challenges that require attention. Also, understand the business benefits of AI agent adoption that are

critical for the success of the enterprise. Select the targeted use cases and perform the proof of concepts (POCs) that can deliver the desired business and operational outcomes. Build value through improved productivity, growth, and new business models.

Change management: Implement change management to help teams to adapt new AI-driven workflows. Establish clear communication, stakeholder engagement, and support systems to ease the transition.

Ethical values: Address ethical considerations related to the use of AI agents, such as bias, fairness, and transparency. Implement ethical guidelines and review processes to ensure responsible AI deployment.

Infrastructure: Ensure that the existing IT infrastructure can support the deployment of AI agent systems. This involves upgrading hardware, software, and network capabilities to handle the increased computational demands.

Upskilling: Reskill employees to improve productivity by conducting various training courses and encourage

them to perform POCs. Also, based on the role and skills of employees, identify the skill gaps and train them effectively to contribute to the enterprise transformation initiatives.

Risk management: Develop strategies to identify, assess, and mitigate risks associated with an AI agent. Implement robust monitoring and auditing mechanisms to track AI behaviour and ensure accountability.

AI agent reference architecture

Figure 2 shows the contextual architecture of an AI agent, giving its key components and layers.

Input data sources: Data sources provide the insight required to solve business problems. These are structured, semi-structured, and unstructured, and come from many sources such as user interactions, real-time data streams, and multi-model data covering images, text, video, audio, etc.

AI agents: AI agents process the input data coming from various data sources. The data is formatted in a way that it is interpretable by the LLM. The AI agent analyses the response
