

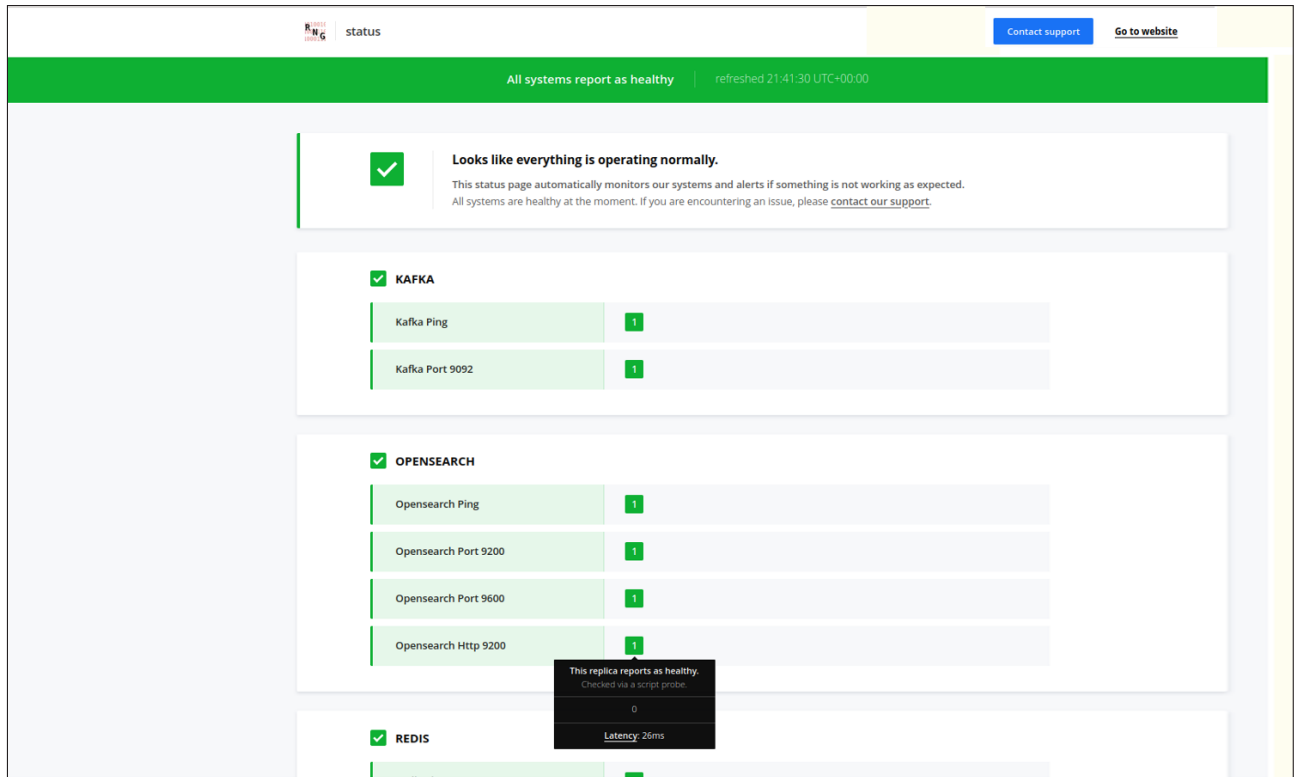

Figure 7: Vigil status page after fixing the HTTP probe

```
> /usr/bin/curl -k https://admin:admin@opensearch:9200
> return $?
> '''
> ]
```

Now execute the Docker commands used previously to launch the Vigil service, copy the new Vigil config, and restart the Vigil service respectively. Voila, the script probe fixes the limitation of the HTTP probe as shown in Figure 7.

You can administer Vigil through its APIs as well to publish public announcements, manually report node metrics, etc. The Vigil GitHub project page has the information to help you make use of its Manager and Reporter HTTP APIs. There is also a related optional component known as Vigil Local in case you are looking to report the health of some local services on the Vigil status page. Last but not the least, you can make use of Vigil Reporter libs provided for various programming languages to actively submit health information to Vigil from your apps. All this information should be enough for you to make full use of Vigil's capabilities to craft a powerful black box monitoring status page.

Having a reliable and cost-effective monitoring solution is essential for businesses of all sizes. This article explored two popular free and open source tools that enable IT teams to set up status pages for black

box monitoring of their infrastructure. By leveraging these solutions, businesses can proactively detect and address issues before they impact operations. With just a running Docker engine, setting up these tools is simple. Implementing the right monitoring strategy ensures better system reliability, improved response times, and overall operational efficiency, making it a crucial investment for any technology-driven organisation.

In the next part in this series of articles, we will explore Statping-ng, another powerful open source tool for setting up status pages and monitoring your IT infrastructure. Stay tuned!
