

KDE Frameworks 6.1 released

The KDE Project has announced the release of KDE Frameworks 6.1, the first stable update to the KDE Frameworks 6 series. This collection of more than 80 add-on libraries to Qt provides functionality for the latest KDE Plasma 6 desktop environment and KDE Gear suite of apps.

Key highlights of KDE Frameworks 6.1 include:

- A new filter for the icon chooser dialog, allowing users to view only symbolic icons or hide them.
- Improved keyboard navigation in Kirigami sidebars powered by the GlobalDrawer component.
- Increased size of the 'Get new plasma widgets' dialog for better usability.

Updates to the Plasma System Monitor app include fixes for charts appearing correctly on computers with older Intel GPUs, improved 'Horizontal bars' graphs in various system monitor widgets to use the correct colours, and fixes for glitchy horizontal lines on graphs and charts when using a fractional scale factor with certain Intel GPUs.

The 'Get new [thing]' dialogs have been enhanced to allow sorting by the highest number of downloads, address issues with installation progress display, and resolve problems with getting stuck after uninstalling apps.

For Kirigami-based apps, KDE Frameworks 6.1 improves the animation used when moving apps between pages to be smoother and updates the toolbar separator line to look more natural.

For QtQuick-based apps, KDE Frameworks 6.1 no longer shows animations if they're globally disabled, fixing an issue on the Plasma desktop where button highlights disappeared. It also adds support for translating menu items in context menus for text fields.

Additionally, Breeze-themed radio buttons and checkboxes have been updated to use the 'Button' colour role for improved visual consistency and to fix a visual glitch in QtQuick-based apps.

The model's capabilities have been showcased through datasets ranging from 2015 to 2059 for the contiguous United States, with plans for more extensive releases. Its outputs are accessible on Amazon Web Services, enabling researchers and planners to perform comprehensive studies on potential climate scenarios and their impact on energy systems.

According to Dan Bilello, director of the Strategic Energy Analysis Center at NREL, Sup3rCC will revolutionise the planning of future energy systems by providing foundational data that can influence decision-making processes crucial for maintaining reliable energy supplies.

WordPress 6.5 'Regina' released

WordPress 6.5, named 'Regina', brings significant enhancements to empower users with more control over their site-building experience. This latest version's

Image Source: <https://wordpress.org/>

new features allow for finer customisation, making your website truly your own.

Key highlights include enhanced typography management, more comprehensive revision options in various areas, and updates to the Site Editor that improve performance, enabling smoother and faster workflows.

Regina also introduces developer tools that revolutionise how blocks are used and extended for creating engaging experiences. The Interactivity API opens up new possibilities for creative frontend design, while the Block Bindings API enables seamless dynamic connections between blocks and data.

This release boasts over 110 performance updates, resulting in significantly faster loading times and improved efficiency in both the Post Editor and Site Editor. Loading times are now over two times faster compared to the previous version (6.4), with input processing speed up to five times faster.

The update includes more than 65 accessibility improvements, making WordPress more accessible than ever. It addresses issues such as unblocking access to admin submenus for screen reader users and keyboard navigators, improving colour contrast in admin focus states, fixing element positioning, and enhancing cursor focus.

Shortly after the release, a security and maintenance update was issued, featuring two bug fixes for Core, 12 bug fixes for the Block Editor, and one security fix. Since this is a security release, it is highly recommended that you update your WordPress sites immediately.

Redis switches to a dual-licensing model

Redis, a leading in-memory database vendor, has announced a shift to a dual-

licensing model, introducing stricter terms for companies providing Redis as a service. Moving forward, all new versions of Redis will be released under source-available licences. Beginning with Redis 7.4, Redis

will be dual-licensed under the Redis Source Available License (RSALv2) and Server Side Public License (SSPLv1), discontinuing distribution under the three-clause Berkeley Software Distribution (BSD) licence.
