

The new licences aim to sustainably provide permissive use of the source code. Redis is transitioning to a real-time data platform that integrates a unified set of clients, tools, and core Redis offerings. The Redis source code will remain freely available through Redis Community Edition, unifying core Redis with Redis Stack, which includes search, JSON, vector, probabilistic, and time-series data models in a single, easy-to-use package. This enables Redis to be used across various contexts, such as a high-performance key/value and document store, a powerful query engine, and a low-latency vector database for generative AI applications.

Under the new licensing terms, cloud service providers hosting Redis offerings will no longer be allowed to use the Redis source code without agreeing to licensing terms with Redis. This change ensures support for existing integrated solutions and grants access to future Redis innovations.

Julia Liuson, president, developer division at Microsoft, said: “Our collaboration continues to support integrated solutions like Azure Cache for Redis, and will provide Microsoft customers with exclusive access to expanded features within Redis offerings.”

For the Redis developer community, there are no significant changes, as they will continue to benefit from permissive licensing. Additionally, all Redis client libraries under Redis’s responsibility will remain open source. Redis will also support its partner ecosystem, including managed service providers and system integrators, providing exclusive access to future releases, updates, and features through its Partner Program. Existing Redis Enterprise customers will not be affected by these changes.

SUSE strengthens container management portfolio

SUSE has unveiled updates to its cloud-native and Edge portfolio. These updates are designed to help customers securely deploy and manage critical workloads across various environments.

The enhancements in Rancher Prime 3.0, SUSE’s commercial offering of Rancher, focus on providing choice and security through entirely open source solutions. Rancher is a widely adopted open source enterprise container management platform. Additionally, SUSE Edge 3.0 also emphasises security and choice, ensuring secure platforms for customers through fully open source solutions.

“At SUSE, our commercial and open source users are equally important,” said Peter Smalls, general manager of the SUSE Enterprise Container Management business unit. “As such, our mission is two-fold; we need to deliver the capabilities our enterprise customers require in order to deploy and manage their business-critical production workloads, while also continuing to invest in innovation to support and grow our huge community of open source users. Today’s announcement speaks to both.”

In Rancher Prime 3.0, platform engineering teams can now offer self-service Platform-as-a-Service (PaaS) to their developer communities, along with enhanced support for AI workloads. The new enhancements include a secure software supply chain, software life cycle management, cluster API and cluster classes, and Rancher Prime application collection. Certified Kubernetes distributions RKE2 and K3s now automatically detect and configure Nvidia’s container runtimes, simplifying the deployment of AI/ML workloads.

Additionally, SUSE is introducing Rancher Enterprise, which offers a comprehensive package and pricing for the entire Rancher Prime portfolio. This includes multi-cluster management, OS management, VM management, persistent storage, and SUSE’s certified Linux OS — SUSE Linux Enterprise Micro.

Canonical announces new subscription service for IoT devices

Canonical, the creator of Ubuntu, has introduced a new subscription service for IoT deployments, offering 10 years of security maintenance for Ubuntu and thousands of open source packages. This service, called Ubuntu Pro for Devices, aims to enhance security and ensure long-term compliance for IoT deployments.

Initially launched in 2021 as part of Ubuntu Advantage for enterprise customers seeking extended security updates, Ubuntu Pro has now expanded to offer a free tier for personal and small-scale commercial use, covering up to five machines. With this expansion, Ubuntu Pro now caters to IoT devices, providing security coverage for critical, high, and medium common vulnerabilities and exposures (CVEs) for Ubuntu and various open source packages like Python, Docker, OpenJDK, OpenCV, MQTT, OpenSSL, Go, and Robot Operating System (ROS).

“Ubuntu Pro for Devices can be combined with Canonical’s existing Ubuntu Certified Hardware program to offer a best-in-class Ubuntu experience on devices out-of-the-box and for up to 10 years,” said a spokesperson from the company.

The Ubuntu Pro for Devices subscription includes device

Landscape system management tool, along with access to real-time Ubuntu kernels for latency-critical applications. To purchase the subscription, you can contact Canonical directly or any of the original device manufacturers (ODMs) in Canonical’s partner ecosystem, such as Adlink, AAEON, Advantech, and DFI.
