

run' approach. Start with a pilot project to test your ideas and strategies. This helps in gaining practical experience and building confidence in your chosen path. Be prepared to realign your strategy if needed. Constantly review and refine your approach based on your experiences and outcomes. Meanwhile, recognise and celebrate your achievements, no matter how small. Building components in open source can be exciting, and showcasing your technological capabilities should be a source of pride.

Open source is a continuous learning journey. Not every component you develop will be widely adopted or successful, and that's okay. Learn from these experiences to understand what the industry needs and how you can provide value. Use a component as a learning opportunity if it doesn't gain traction. Analyse why it wasn't as

successful and apply those learnings to future projects. Use open source as an opportunity to experiment and improve your skills. Even if a component isn't immediately successful, the experience you gain in developing it is invaluable. It helps you understand how to create better software that meets the community's and your clients' needs.

Q: How do you handle situations where a similar product already exists in open source?

A: In the open source domain, the concept of competition is quite different. It's not about competing against each other but more about meritocracy. The focus is on who has written the best code and which product works well and is preferred by users. That's the beauty of open source – it's based on the quality and utility of the software. When you

have multiple options for a similar kind of product in open source, it becomes a matter of evaluating and choosing the best solution, based on factors like stability, the number of adopters, and the level of active contribution.

If another product has better features or greater adoptability, we take it as a learning opportunity. We analyse why the other product is more popular and apply those insights to our future projects. We don't see it as a competition to be won but as an opportunity to learn and improve.

If another product is better suited for a particular purpose, we are open to using it ourselves. The open source community thrives on this collaborative approach, emphasising using the best available tools, whether developed by us or someone else. We also integrate other open source components into our software, embracing the collective strength of the community. **END** 🐧
