

How to Measure and Track the Effectiveness of Software Features Deployed in a Production Environment

A software may require a new update or release due to certain capability improvements or bug fixes. In the final part of this two-part series of articles, we will look at the solution proposed for the problem defined in the first article published in the April 2024 issue of *OSFY*.

In the first article in this series, we have already discussed category weightage (CWT), category value (CV) and category change percentage (CCP). Let us proceed further.

- **Feature effectiveness measure (FEM)**

This critical indicator is used to assess the overall effectiveness of a software feature by considering the weighted averages of its performance across all four major categories, namely daily active users (DAU),

session duration (SD), conversion rate (CR), and customer lifetime value (CLV). It provides a holistic view of how well the feature is performing based on a combination of these essential categories. The FEM serves as a key benchmark for evaluating the feature's success over a defined time frame.

- **Monthly FEM (MFEM):** The monthly FEM is a variation of the feature effectiveness measure calculated at the end of every month. MFEM
