Feedback loop

After implementing features, the key step is to act on FEI results in the feature management system, making informed decisions based on insights gathered during the feature life cycle. Ongoing optimisation, often involving multiple iterations, ensures software features meet user and business

objectives. If a deployed user feature has a red FEI, a systematic approach is vital to understand issues, make improvements, and optimise the effectiveness. Consider the following steps in this situation:

- Pinpoint where the feature is falling short. Is it not meeting user needs or failing to drive desired user actions?
