

environment for applications. Here are step-by-step instructions for the Amazon AWS cloud computing platform's VPC and web server setup.

Step 1: Deploy virtual private cloud (VPC) in an experimental setup

Setting up virtual private clouds (VPCs) is easy with Amazon VPC. VPCs can be part of more than one AWS region, as shown in Figure 3.

Step 2: Create and configure VPC settings

We first create the VPC using the name 'LAB VPC Aditya Bhardwaj'. Then, IPV4 and IPV6 CIDR block addresses are configured, as shown in Figure 4.

Step 3: Create VPC subnets

The user can create the subnet from the VPC dashboard. Configure the following subnet settings:

- **Enter the name of the subnet:** This is 'Work PublicSubnet' in our case
- **VPC:** Now, select your created VPC (e.g., 'MyVPC').
- **Choose an availability zone:** You can now choose the subnet availability zone (e.g., 'N. Virginia').
- **Set the IPv4 CIDR block:** Finally, create the subnet as shown in Figure 5.

Step 4: Configure a security group
AWS cloud security groups can be
