

configured using the VPC dashboard. In our setup, the security group's name is 'WebServerSG'.

Step 5: Launch EC2 instance and deploy web server

- **Navigate to the EC2 Dashboard:** Go to 'EC2' in the AWS management console.
- **Click 'Launch Instance':** Choose 'Launch Instance' as depicted in Figure 6.

- **Choose an Amazon Machine Image (AMI):** Select a suitable AMI (e.g., Amazon Linux 2 AMI).

To configure the instance details, start by selecting the network for your instance. Choose your VPC, such as 'MyVPC', to ensure the instance is launched in the correct network environment. Next, select the public subnet you created, like 'PublicSubnet', to place the instance in a subnet that allows public access. In our case, we

have named the instance 'OSFY Web Server', as shown in Figure 7.

Step 6: Verify your web server

Finally, a web browser launches an EC2 instance using the public IP address. After successful installation, the default web server web page will be opened, as shown in Figure 8.

Creating a VPC and deploying a web server on AWS requires seamlessly integrating multiple components. This
