

```

matrix@ankur-Inspiron-5593:~/Development/Git/Works/devops/CloudInABox/Multipass/scripts$ ./create_multipass_machines_stack.sh
Usage: create_multipass_machines_stack.sh
< ping - test ssh connectivity to created local cloudvms |
start - start all local cloudvms |
stop - stop all local cloudvms |
show - dumps info about all local cloudvms |
create - bringup fully configured localvm for,
[cassandra|consuldev|opensearch|
kafka|kafka-kraft|nomadev|spark|vaultdev] |
delete - deletes all local cloudvms |
cleandelete - cleanup everything for all local cloudvms >

```

guest/guest) and *consuldev*.
localhost:8500, respectively.

You can get into the created instance using the command `ssh -oStrictHostKeyChecking=no ubuntu@consuldev.local` and clean up everything by giving the command `./create_multipass_machines_stack.sh cleandelete` when done. The tooling around Multipass through the wrapper script makes developing and cleaning the fully configured local cloud VMs a cakewalk.

Fat containers are great to build a lightweight fleet of cloud VMs on your laptop, even without any hardware virtualisation support. Multipass is another must-have tool for modern

cloud and infrastructure/platform developers. When combined with cloud-config data it is useful in building public cloud kind of fully configured

Ubuntu instances locally. The usage of fat containers and Multipass accelerates developer productivity and slashes public cloud bills. **END** 🐧
