

development, testing, and deployment of artificial intelligence and generative AI models. Through this partnership, RHEL AI is established as a preferred platform for Dell's PowerEdge R760xa server.

"Validating RHEL AI for AI workloads on Dell PowerEdge servers provides customers with greater confidence that the servers, GPUs, and foundational

platforms are tested and validated on an ongoing basis. This simplifies the gen AI user experience and accelerates the process to build and deploy critical AI workloads on a trusted software stack," said Arun Narayanan, senior vice president, Dell Technologies.

This collaboration empowers organisations to implement scalable artificial intelligence and machine learning strategies more efficiently, enhancing IT systems and powering enterprise applications. By combining optimised AI-enabled hardware with the trusted RHEL AI platform on Dell PowerEdge servers, the partnership delivers a more consistent AI experience. To simplify adoption, Dell and Red Hat are continuously testing and validating hardware solutions, including NVIDIA accelerated computing, for seamless integration with RHEL AI.

RHEL AI on Dell PowerEdge servers is available with a test drive option at Dell Customer Solution Centers worldwide.

Bob Pette, vice president, enterprise platforms, NVIDIA, explained, "In today's fast-paced market, it is critical for organisations to be equipped with validated and trusted AI-enabled solutions to kickstart their gen AI use cases. Red Hat and Dell will extend gen AI capabilities for customers with an optimised experience for NVIDIA accelerated computing, including NVIDIA H100 Tensor Core GPUs, with Dell PowerEdge servers and RHEL AI."

Python in Excel now generally available for select Windows users

Python in Excel is now generally available for Windows users of Microsoft

365 Business and Enterprise. Last August, Microsoft, in collaboration with Anaconda, introduced a groundbreaking feature by integrating Python into Excel, allowing users to effortlessly combine Python and Excel analytics in a single workbook with no setup required. Since then, Microsoft has brought the power of popular Python libraries, including pandas, Matplotlib, and NLTK, to countless Excel users, enhancing their analytical capabilities.

"Seamless integration of Python data structures like pandas data frames and NumPy arrays in Excel is a total game changer. This expanded access to Python will create exciting new opportunities for innovation as well as making it even easier for business analysts and data scientists to collaborate," said Wes McKinney, creator of pandas.

With Python in Excel, users can leverage advanced analytics for tasks like visualisations, data cleaning, machine learning, predictive analytics, and much more.

Jack McCulloch, principal partner PM – Microsoft business and industry copilots, said, "Using Python in Excel has significantly streamlined my workflow... It has made complex data handling and visualisation straightforward and efficient. The feature requires no setup, saving me significant time. The integration has made advanced data manipulation more accessible."

Despite the excitement around Python in Excel, the general release is limited to a specific group: users running Excel for Windows with an Enterprise or Business Microsoft 365 subscription on the Current Channel. On unsupported platforms like Mac and Android, while users can view Python code in Excel workbooks, attempting to run calculations will result in an error. Even the web version of Excel is excluded from executing Python code, as Microsoft noted.
