

Trust project Hiero. Hiero is a powerful decentralised ledger platform that utilises a unique consensus mechanism.

Eric Piscini, CEO of Hashgraph, said: “We are excited to join Linux Foundation Decentralised Trust as a founding member and strengthen our partnership with a community dedicated to open source technology.

“Trust is essential for the widespread adoption of DLT and decentralised systems, and we are committed to collaborating with fellow members and projects to build innovative, scalable solutions. We see significant potential in enhancing interoperability and are eager to advance these initiatives.”

AlmaLinux launches SIG to lead new hardware certification programme

The AlmaLinux OS Foundation, the nonprofit organisation responsible for AlmaLinux, the free and community-governed open source enterprise Linux distribution, has announced the formation of a special interest group (SIG) aimed at boosting user confidence through official AlmaLinux hardware certification.

Jonathan Wright, the infrastructure team lead for AlmaLinux and the first chair of the SIG, will lead the global group of community members responsible for upholding standards and managing the new AlmaLinux OS Foundation Hardware Certification Programme. Full details of the certification programme and SIG information can be found at <https://wiki.almalinux.org/sigs/Certification.html>.

The new certification SIG will oversee a straightforward yet comprehensive certification process that takes days rather than months. It has developed a streamlined, collaborative framework enabling independent hardware

vendors (IHVs) and the AlmaLinux OS Foundation (ALOSF) to certify hardware compatibility with AlmaLinux OS. The programme utilises an open source certification toolkit developed by

ALOSF, based on a range of open source hardware and software testing projects and tools. Further details of the certification programme are available on the AlmaLinux website at <https://almalinux.org/certification/>.

Those interested in contributing to the SIG and shaping future developments in the certification process are encouraged to join its meetings or participate in the chat room. Details are available at <https://wiki.almalinux.org/sigs/Certification.html>.

Benny Vasquez, chair of the AlmaLinux OS Foundation, said, “We’re committed to providing a clear and consistent path toward hardware certification – and I’m confident in the effectiveness of this group as they cement this new process.”

Yuji Kitamura, president and CEO of Cybertrust Japan Co., Ltd, a platinum sponsor of the AlmaLinux OS Foundation, said: “We believe that the newly launched Hardware Certification Programme for independent hardware vendors (IHVs) will significantly enhance the usability of AlmaLinux OS for enterprise users. Cybertrust Japan is committed to supporting this initiative by leading the operational verification and certification of various devices in Japan.”

Distributed via a network of over 400 mirrors, AlmaLinux is a free, open source, community-governed enterprise Linux distribution compatible with RHEL and pre-Stream CentOS.

Intel and AMD make power management improvements for Linux 6.12

The major set of power management updates for Linux 6.12 has now been implemented by Intel and AMD. On the Intel side, the update introduces hybrid CPU capacity scaling support within the Intel P-State driver, which is particularly significant for upcoming Intel Core Ultra 200 Series ‘Lunar Lake’ laptops. These laptops feature a mix of performance (P) and efficiency (E) cores but lack simultaneous multi-threading (SMT) support. This hybrid scaling is critical for optimising performance. Additionally, support for Intel Lunar Lake on Linux and benchmarks has been made available on Phoronix.

Further improvements in the Intel P-State driver include support for Granite Rapids and Sierra Forest when operating in out-of-band (OOB) mode. The Intel Idle driver also adds compatibility for the upcoming Intel Xeon 6 ‘Granite Rapids’ processors. Moreover, the Intel RAPL PowerCapping code now includes support for Arrow Lake U processors.

On the AMD side, the AMD P-State driver has been updated to refine boost calculations and AMD Preferred Core detection. The Run-Time Average Power Limiting (RAPL) code now detects AMD Family 1Ah ‘Zen 5’ CPUs, enabling power monitoring for Zen 5 processors.

Additionally, Linux 6.12 power management code removes the old LATENCY_MULTIPLIER, which had been slowing down CPU frequency polling.

With Linux 6.12 anticipated to be this year’s long term support (LTS) kernel, these updates for Intel and AMD are particularly significant. The stable release of Linux 6.12 is expected in November this year.
