

OpenText releases Cloud Editions 24.3

OpenText has announced the launch of its latest product Cloud Editions (CE) 24.3. This release marks a major advancement in combining advanced information management capabilities, reliable cloud solutions, strong security measures, and state-of-the-art artificial intelligence (AI) to enhance data performance and deliver superior results efficiently.

Today's chief information officers (CIOs) face the challenge of balancing AI and cloud technology as key drivers of business transformation. A report indicates that 68% of CIOs expect generative AI and large language models (LLMs) to influence their investment priorities. With the ongoing shift to the public cloud, which hosts about 36% of application workloads and is projected to reach 53% by the end of 2026, both AI and cloud are top IT expenditure priorities. OpenText's latest AI-enabled innovations aim to meet these needs, offering solutions designed to drive growth.

CE 24.3 introduces significant offerings across business clouds, business AI, and business technology.

For business AI, the DevOps Aviator accelerates application delivery by using testing bots to generate codeless tests, reducing risks and addressing talent shortages. An integrated AI-guided assistant streamlines development workflows. The Fortify Aviator automates auditing and remediation of SAST vulnerabilities, integrating fix suggestions into the DevOps workflow. It also provides user-friendly explanations to simplify the process and protects against vulnerabilities in LLMs.

For business cloud, the Content Aviator is available on multiple OpenText platforms to enhance content management workflows. This release includes capabilities for high-quality video content, improving workflow efficiency and user productivity.

For business technology the Thrust Studio is a real-time digital assistant powered by generative AI. It accelerates development by providing quick access to relevant code samples and API documentation.

OpenText releases new AI capabilities every 90 days as part of their quarterly Cloud Editions. Muhi Majzoub, EVP and chief product officer at OpenText, emphasised that 2023 focused on testing basic AI fundamentals, while 2024 is about scaling AI adoption.

Bug fix in Linux 6.11 will improve the performance of AMD HDMI audio

For those who have experienced issues with AMD HDMI audio on recent Linux kernel versions, a fix has been submitted for Linux 6.11. This addresses what has been described as “another long-time regression fix for AMD HDMI.” The issue stems from a change made to the Linux HDA audio driver, where snooping for AMD HDMI hardware was not being used conditionally. This problem traces back to a March 2022 update to the Linux kernel, which removed the `CONFIG_DMA_REMAP` option. As a result, users with AMD HDMI audio, particularly those using Navi graphics cards, reported issues such as audio skipping, stuttering, and white noise.

A recent bug report brought this to attention, where the reporter provided a detailed bisecting of the problem, leading to prompt action from the developers. The submitted fix aims to resolve these issues, improving the overall stability and performance of AMD HDMI audio on affected systems. Takashi Iwai of SUSE and the longtime Linux sound subsystem maintainer worked through a fix where he explained: “The recent regression report revealed that the use of WC pages for AMD HDMI device together with AMD IOMMU leads to unexpected truncation or noises. The issue seems triggered by the change in the kernel core memory allocation that enables IOMMU drivers to always use S/G buffers. Meanwhile, the use of WC pages has been a workaround for the similar issue with standard pages in the past. So, now we need to apply the workaround conditionally, namely, only when IOMMU isn't in place. This patch modifies the workaround code to check the DMA ops at first and apply the snoo-off only when needed.”

The fix for the AMD HDMI audio issues is now in the Linux 6.11 Git repository, and will be eligible for back-porting to a stable kernel series, ensuring that users on earlier versions of the Linux kernel can benefit from it as well. This should help address the audio skipping, stuttering, and white noise issues that have been affecting users with AMD HDMI audio hardware, particularly those with Navi graphics cards.
