

A: Cloud attacks happen within minutes, so the cloud security challenge for organisations is twofold: detecting and responding to threats before malicious actors can complete attacks and identifying which vulnerabilities — among the thousands that exist — pose an immediate risk.

To tackle the first challenge, we built the world's first and only cloud detection and response framework (555 Benchmark) with analysts and practitioners across the industry to help security teams prepare to outpace threats: 5 seconds to detect, 5 minutes to investigate and correlate signals, and 5 minutes to initiate a response. The Sysdig CNAPP provides teams with correlated findings and anomalies. To support the second challenge, Sysdig comes with an "in use," feature, previously known as risk spotlight, to pinpoint vulnerabilities within specific microservices of an application that are actively exploited. This capability allows us to notify organisations promptly, urging them to address critical vulnerabilities within 24 hours. CNAPP solutions are associated with being noisy due to the fast and vast nature of the cloud, but by focusing attention on what matters, our solution filters out 95% of alerts. It is a key differentiator in our product and attracts many organisations to us, including very large organisations that understand the competitive edge real-time security offers.

Q. Do you have a free version for the solution?

A: We don't offer a free version of Sysdig Secure, but Falco is the de-facto standard for cloud-native threat detection; we created Falco and donated it to the Cloud Native Computing Foundation (CNCF). It forms our core and is open source software for all. We operate on a Pareto principle basis, focusing on the

critical problems we solve. Organisations interested in our solutions typically engage in a proof of value (POV) approach. For a fixed period, which can range from a week to two months, we demonstrate how our product addresses their specific use cases and solves their challenges. Through these POVs, customers experience firsthand the benefits of our product.

Q. What role does open source play in your quest to reach out to more customers?

A: We are a company of builders and open source is at our core. We started with open source tools and then expanded into our commercial product offerings. We did this because we believe in the power of open source and the community. We know the bad guys are working together and we believe defenders should do the same to push each other to be more secure, competing vendors included.

We donated Falco to the Cloud Native Computing Foundation (CNCF) because we know the power of threat detection and response, and wanted to push the security industry. But we did not stop there. We are the main sponsor of Wireshark, the most popular network analyser, which we are working to extend to the cloud. Our open source-dedicated engineers also contribute to other projects, including eBPF. We donated the largest repository of eBPF libraries a few years ago. By working with the open source community, we can help push the security industry forward, and by building our products on open source, our customers have visibility into their security, giving them more flexibility.

Simarpreet Singh, Regional Director, India, Sysdig

Q. Are you also integrating other open source components in your commercial version, besides Falco?

A: We're deeply rooted in Falco. Our founder, Loris Degioanni, was a co-creator of Wireshark. He recognised early that containers would have the same visibility challenges as networks, which is the idea Sysdig was born from, and he started first with open source tools. Our contributions to the open source community have been substantial, which I already mentioned. Falco, for example, has around 120 million downloads and is used by companies like IBM, Google, and AWS.

Q. What are the challenges that come with integrating open source components in your commercial offering?

A: Foundationally, we believe in cloud security — that a more secure cloud is fundamentally a good thing across the board. Falco's open
