

AI Services in Microsoft Azure: Designed to Help

Microsoft's Azure AI services enable optimised operations in industries as varied as retail, healthcare, manufacturing, finance, education, and media.

Azure AI is a powerful platform that can help solve various problems in your organisation using artificial intelligence and machine learning. It has a range of services that can help you create and deploy intelligent solutions for different scenarios, such as computer vision, natural language processing, speech recognition, conversational agents, anomaly detection, and predictive analytics. By using Azure AI services, you can improve customer experience, optimise operations, and enhance innovation.

Computer vision

Computer vision is the ability to understand and analyse visual information, such as images and videos. Azure AI has several services that can help you with computer vision, such as Azure Cognitive Services, Azure Machine Learning, and Azure Custom Vision. These services can help with things like finding faces, recognising objects, reading text, classifying images, and analysing videos. Here are some examples of how computer vision can help in different industries.

Retail: Computer vision can help improve your customer experience, optimise your inventory management, and prevent theft. For example, you can use Azure Cognitive Services to create smart shelves that can tell you when products are out of stock, or smart cameras that can recognise your customers and offer them personalised recommendations.

Healthcare: Computer vision can help improve the diagnosis, treatment, and monitoring of patients. For example, you can use Azure Machine Learning to create custom models that analyse medical images, such as X-rays, MRI scans, and CT scans, and find anomalies, diseases, and injuries.

Manufacturing: Computer vision can help improve quality control, safety, and efficiency in production. For example, Azure Custom Vision can be used to create custom models that can inspect products, machines, and processes, and find defects, faults, and hazards.

Natural language processing

Natural language processing (NLP) is the ability to understand and generate natural language, such as text and speech. Azure AI has several services that can help you with NLP, such as Azure Cognitive Services, Azure Machine Learning, and Azure Bot Service. These services can help you with things like analysing text, finding sentiments, translating language, recognising and synthesising speech, and creating conversational agents. Here are some examples of how NLP can help in different industries.

Financial services and banking: NLP can help improve customer service, compliance, and fraud detection. For example, you can use Azure Cognitive Services to create chatbots that can answer your customer queries, provide financial advice, and process transactions. You can also use Azure Machine Learning to create custom models that can analyse text documents, such as contracts, reports, and invoices, and extract relevant information, such as entities, keywords, and sentiments.

Training and education (learning and development): NLP can help improve teaching and learning outcomes. For example, you can use Azure Cognitive Services to create interactive learning experiences that can provide feedback, assessment, and guidance. You can also use Azure Machine Learning to create custom models that can analyse student data, such as essays, quizzes, and surveys, and provide insights, such as performance, progress, and preferences.

Media: NLP can help improve content creation, distribution, and consumption. For example, Azure Cognitive Services can be used to create content that can adapt to different languages, devices, and formats. You can also use Azure Machine Learning to create custom models
