

PagerDuty and JFrog announce integrations for DevOps and security life cycle

PagerDuty, Inc. has announced new integrations with JFrog. The integrations with JFrog Xray and JFrog Pipelines – both part of the JFrog DevOps Platform – allow customers to observe their entire software delivery life cycle, understanding any changes, and identifying security issues throughout the process. This end-to-end DevOps solution includes DevSecOps, DevOps observability and software development life cycle (SDLC) monitoring for on-premise hybrid and multi-cloud deployments.

Timm Hoyt, global vice president of partners and alliances at PagerDuty, said, “Traditionally, information security was a bottleneck in software delivery. This new integration will not only help remove this bottleneck but help organisations thrive when resolving incidents. We’re proud to partner with JFrog and provide a solution that helps teams manage urgent, mission-critical work that is essential to keeping digital services always on.”

With JFrog Pipelines and PagerDuty, users can simplify and streamline how to identify faulty builds that impact production environments. IT operators can quickly detect incidents, determine root causes, roll back builds and shrink resolution time.

The company said that this will help IT operators and developers become more productive, determine what has changed within their environment, and make them better able to prevent outages and increase the uptime, stability and reliability of business-critical applications and digital services.

DataStax expands in Asia-Pacific with new Singapore headquarters

DataStax has announced it has expanded its footprint in the Asia-Pacific (APAC) market with the opening of a new office in Singapore. It said that establishing regional

headquarters in Singapore marks a major global expansion for DataStax, and comes fresh off from the funding from Goldman Sachs. The expansion reinforces DataStax’s commitment to APAC, and enables the company to meet the growing global demand for its marquee offering

Astra, an open data stack for modern data apps built on Apache Cassandra.

Chet Kapoor, chairman and CEO at DataStax, said, “We see an impressive opportunity for growth in APAC. We are excited to expand our presence in APAC to help the growing number of enterprises adopting an open data stack to accelerate their digital transformation.”

According to a *ResearchandMarkets.com* report titled ‘Global Cloud Database and DBaaS Market (2020 to 2025)’, Asia-Pacific is expected to have the highest growth rate over the forecast period.

Red Hat announces general availability of its migration toolkit for virtualisation

Red Hat, Inc. has announced the general availability of Red Hat’s migration toolkit for virtualisation to help organisations accelerate open hybrid cloud strategies by making it easier to migrate existing workloads to modern infrastructure in a streamlined, wholesale manner. By bringing mission-critical applications based on virtual machines (VMs) to Red Hat OpenShift, IT organisations can experience a smoother, more scalable modernisation experience while mitigating potential risks and downtime.

IT organisations are tasked with addressing existing systems and workloads, many of which may run on infrastructure or resources that aren’t compatible with the realities of modern computing. Modernising these deployments can be time consuming, costly and overwhelming for developers, IT operations teams and business users without the necessary tools. To help organisations break down application barriers between traditional and cloud-native workloads, Red Hat announced OpenShift Virtualization in 2020. With OpenShift Virtualization, Red Hat brought traditional application stacks forward into a layer of open innovation, enabling customers to truly transform at their own speed.

The company added, “Red Hat is working with customers and partners to modernise and migrate projects to help enable cloud-native capabilities through migration toolkits that come with OpenShift. These offerings now include the migration toolkit for virtualisation by Red Hat, which helps migrate VMs at scale to Red Hat OpenShift. This gives organisations the ability to more easily access workloads running on virtual machines, while developing new cloud-native applications. Migrations are performed in a few simple steps, first by providing source and destination credentials, then mapping the source and destination infrastructure and creating a choreographed plan and, finally, executing the migration effort.”
