Figure 9: Http2 advantages

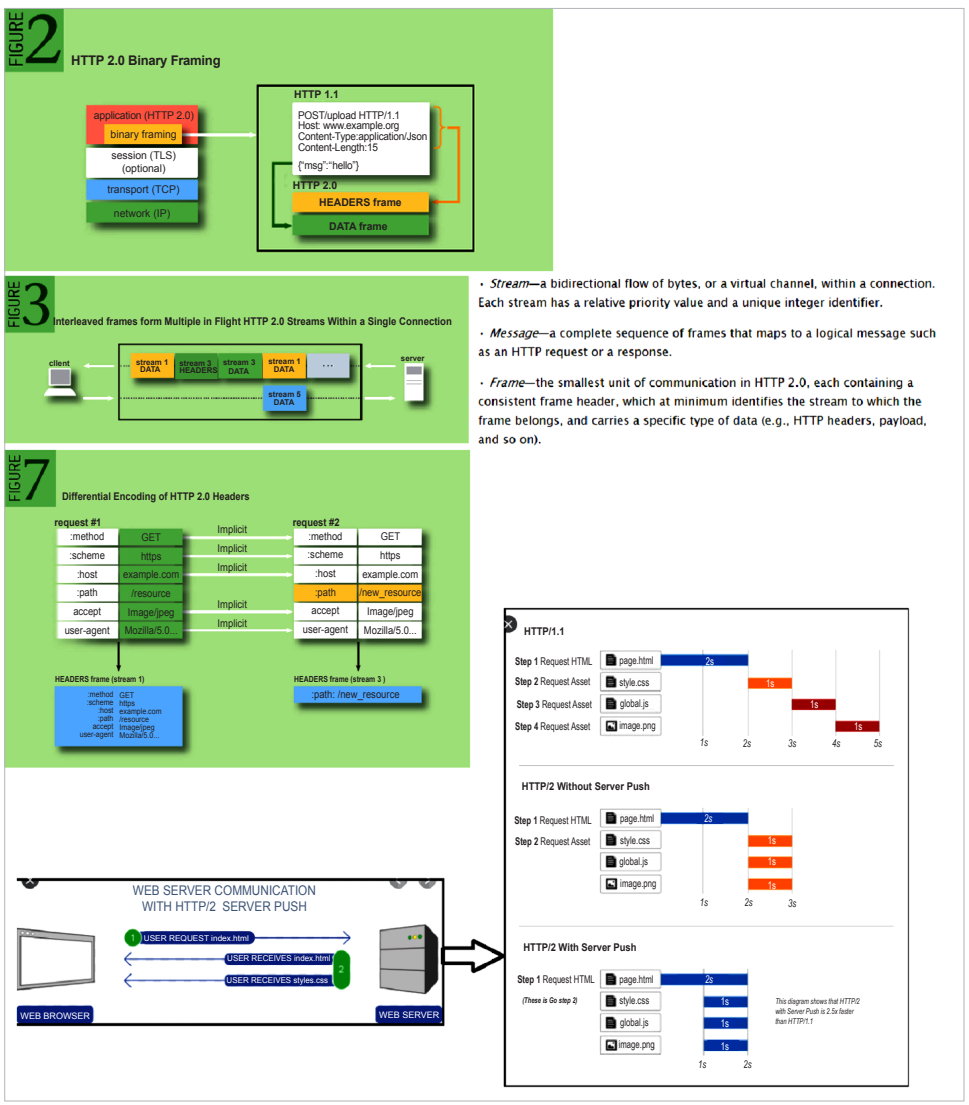

Figure 10: Http2 advantages in detail

To demonstrate this further, let's look at some of the familiar websites we often use (Figure 7).

One way people tackle the sluggish response time is by hosting the content servers across the globe using some CDN (content delivery network), e.g., Akamai (or any cloud vendor).

The trends

Http2: The following advantages of http2 protocols are seen (Figure 9):

1. Same TCP connection (20815) due to stream multiplexing.
2. Response size reduction, due to header compression
3. Impressive overall performance gain.

The series of pictures given in Figure 10 depict the advantages of http2 in a better way (Reference: *https://queue.acm.org/detail.cfm?id=2555617* and *https://www.igvita.com/*).

TLS v1.3: This has the following advantages:

1. Better speed as one round-trip-time (RTT) is reduced by one-third in TLS v1.3.
2. Better security as fine tuning has been done to avoid attack surfaces like RC4 and BEAST exploits (Reference: *https://en.wikipedia.org/wiki/Transport_Layer_Security*).
3. Released in 2019 and works seamlessly with http2.

Compression

We carried out a small experiment with the
