

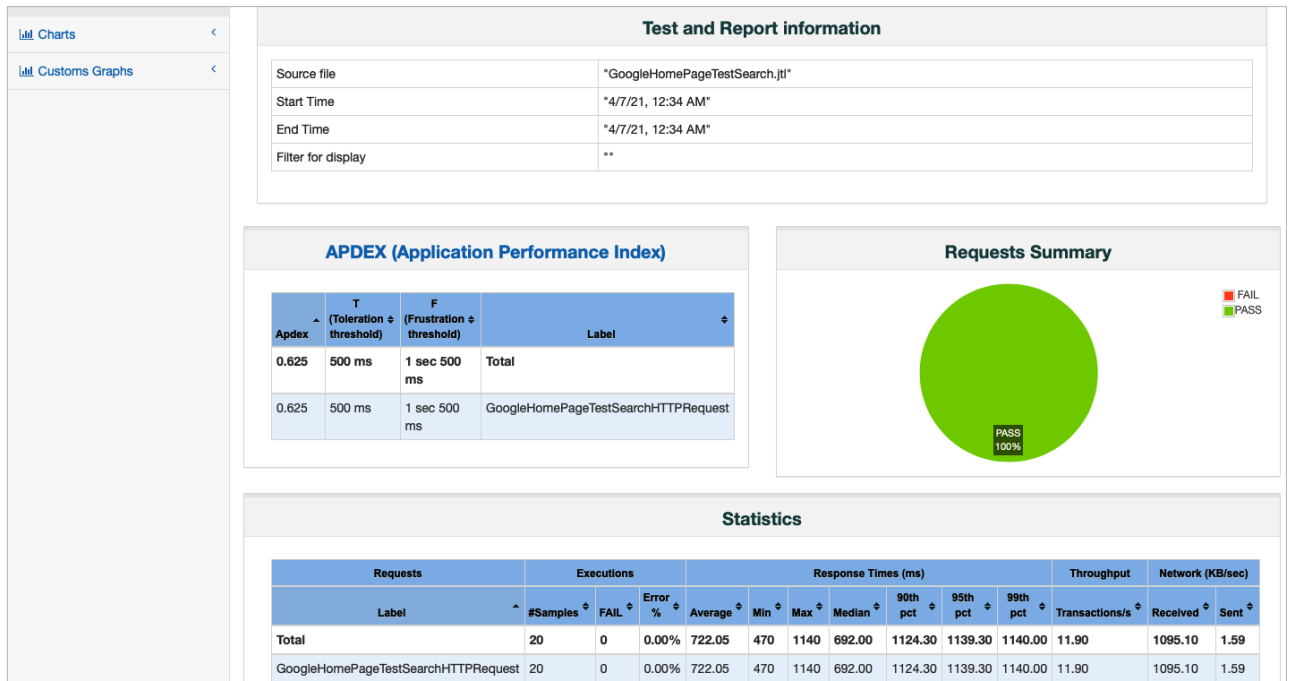

Figure 11: HTML output of the command line execution

The output is shown in Figure 11.

Benefits of JMeter

- **Open source:** JMeter is open source software, so there are no licensing costs
- **Ease of use:** It can be installed and used easily.
- **Platform-independent:** As JMeter is completely Java based, it is platform-independent and can run on multiple platforms.
- **Customisable:** Since JMeter is open source, developers can customise its source code as per their requirements. There is also a prescript and postscript execution process, where we can run customisable code in Java or Python.
- **Data driven testing:** The CSV data set *Config* allows you to read different parameters from the text file and convert them for making dynamic requests.
- **Record and playback:** JMeter provides record and playback options with a drag-and-drop feature. This makes it easier and faster to create scripts.

- **Supports distributed load testing:** JMeter supports distributed load testing features with which we can create a master-slave setup for carrying out load testing on multiple machines (https://jmeter.apache.org/usermanual/jmeter_distributed_testing_step_by_step.html).
- **Good community support and documentation:** JMeter has many online tutorials (I really like Edureka) and great community support. It also has freely available plugins that help in different aspects of script creation and analysis.
- **Reporting:** It helps to visualise test results, which can be displayed as a chart, table, tree, log file, etc.

Drawbacks of JMeter

- Passwords are saved as plain text, which is risky if the *.jmx* file is shared accidentally.
- It supports only Java or Java backed languages for custom coding. Tools similar to JMeter are LoadView, LoadUI, NeoLoad, WEBLOAD, and LoadRunner. JMeter is a popular and widely used tool for performance and API testing. Its feature list is exhaustive, and this article just gives a sample of its usage. The JMeter user manual, which has a detailed description of each of its features, can be found at <https://jmeter.apache.org/usermanual/index.html>.
