

in your Debian box with the following command:

```
sudo DEBIAN_FRONTEND=noninteractive
apt-get install FreedomBox
```

Installing FreedomBox on Single Board Computers

To install FreedomBox, you need the following hardware:

- Any supported device (https://wiki.debian.org/FreedomBox/Hardware#Supported_Hardware) which can run Debian Buster or newer. We will be transforming this to a FreedomBox.
 - A power cable for your device
 - An Ethernet cable
 - A microSD card or equivalent storage media for your device with the image downloaded from the official images page at:
 - <https://freedombox.org/download/>
 - <https://ftp.freedombox.org/pub/freedombox/>
1. Plug one end of your Ethernet cord into FreedomBox's Ethernet port, and plug the other end into your router.
 2. Power on FreedomBox.
 3. On first boot, FreedomBox will perform its initial setup.
 4. After the initial setup is done, you can access its Web interface (called Plinth) through your Web browser.
 - If your computer is connected directly to FreedomBox through a second (LAN) Ethernet port, you can browse <http://freedombox/> or <http://freedombox.local/> (or <http://the-hostname-you-entered-during-install.local/>).
 - If you know your way around the router's Web interface, you can look up the IP address of FreedomBox there and browse that address.

Setting up FreedomBox

The first time you access the FreedomBox Web interface, you will see a 'Welcome' page. Click the 'Start Setup'

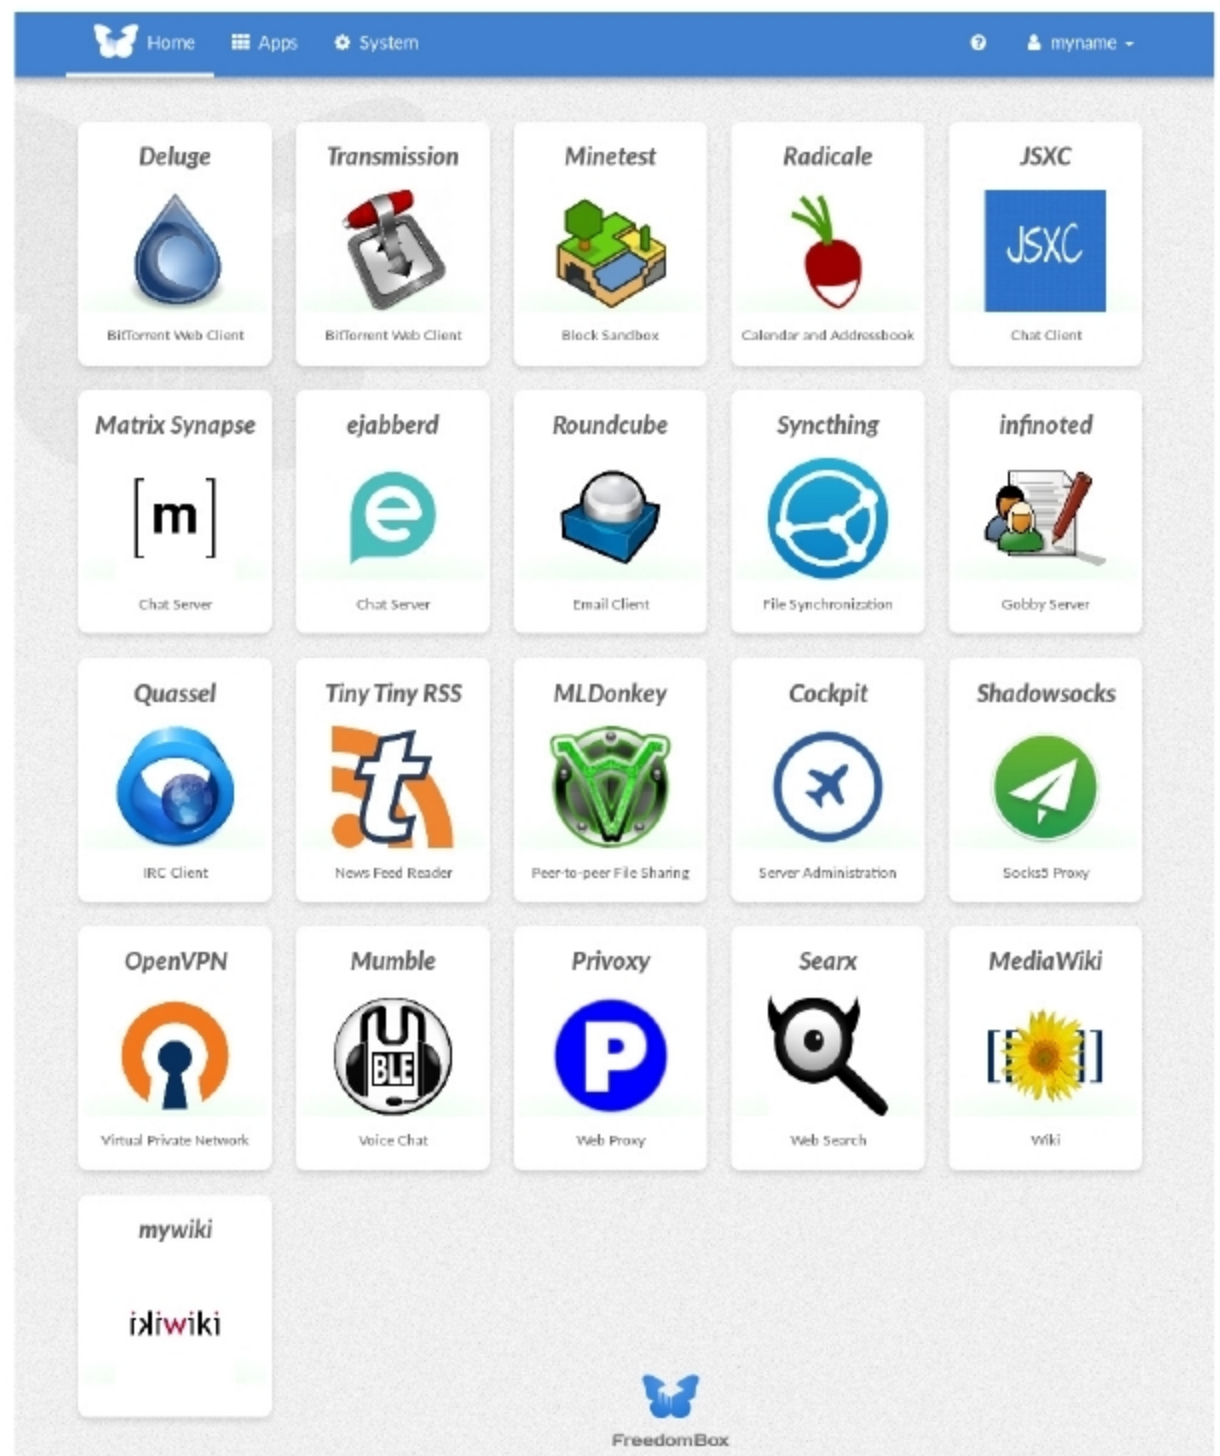

Figure 1: FreedomBox front page

button to continue. If you have installed FreedomBox using a Debian package, you will be asked for a secret key. This secret would have been provided during the installation of the Debian package. It can also be read from the file `/var/lib/plinth/firstboot-wizard-secret`.

Next, you will be asked to set up a user name and password. You can log in to see the front page (Figure 1).

You can also buy a preconfigured Pioneer FreedomBox from Olimex at <https://freedomboxfoundation.org/buy/>. **END** 🐧
