

technology as a core component of its BIC platform for business process modelling and automation.

Gregor Greinke, GBTEC's CEO said, "The integration of Apromore into the BIC platform will provide a one-stop shop for companies seeking to accelerate their digital transformation journey with full-life cycle process optimisation. The analytics capabilities that Apromore brings into the BIC platform are truly exceptional when it comes to identifying under-performing processes, rework loops, waste, and bottlenecks. By joining forces, we are certain to establish one of the best analytics and AI-driven process optimisation tools on the market."

Apromore said that the company is a result of over a decade of extensive research and innovation at the University of Melbourne, University of Tartu (Estonia), and other research institutions globally.

SODA Foundation gets new investments to address growing need for data autonomy

The SODA Foundation, previously OpenSDS, is expanding to include both open source software and standards to support the increasing need for data autonomy. The Foundation hosts an open source, unified and autonomous data management framework for data mobility, from the edge to the core to the cloud.

Foundation sources said that premier members include China Unicom, Fujitsu, Huawei, NTT Communications, and Toyota Motor Corporation. Other members are China Construction Bank, Fintech, Click2Cloud, GMO Pepabo, IIJ, MayaData, LinBit, Scality, Sony, Wipro and Yahoo Japan.

To boost the expansion plans, China Unicom is contributing its S3-compatible object storage YIG project to the SODA Foundation. YIG is the first in a line of projects that are joining the Foundation through the SODA Incubator programme. It is designed to create an ecosystem of data and storage projects by supporting their growth through community outreach, collaboration and adoption.

Steven Tan, chairman, SODA Foundation, and vice president and CTO of Cloud Solution at Futurewei said, "Providing a neutral forum, where both vendors and end users can contribute to building and integrating data management solutions for mobility and autonomy, is our goal. These new investments and our expanding scope will help us support a growing community of open source data professionals who are pushing the envelope on these technologies."

Kong Inc. donates open source Kuma to the Cloud Native Computing Foundation

Kong Inc. has donated Kuma to the Cloud Native Computing Foundation (CNCF) as a sandbox project. The CNCF hosts critical components of the global technology infrastructure, including Kubernetes, and is focused on building sustainable ecosystems for cloud native software.

Matt Klein, creator of the Envoy proxy said, "It's truly remarkable to see the ecosystem around Envoy continue to develop, and as a vendor-neutral organisation, CNCF is the ideal home for Kuma. Now developers have access to the service mesh data plane they love with Envoy, as well as a CNCF hosted Envoy based control plane with Kuma, offering a powerful combination to make it easier to create and manage cloud native applications."

Kuma is a universal control plane that enables seamless management of any service on the network, from any platform. It includes Kubernetes, containers, virtual machines, bare metal, and other environments. Kuma focuses on ease of use and aims to be a turnkey service mesh that can quickly provide value to production environments. It features capabilities like multi-mesh support, hybrid universal mode, global/remote control plane scalability, and built-in service discovery and GUI, among other features.
