

SUSE to acquire Rancher Labs

SUSE has entered into a definitive agreement to acquire Rancher Labs. The latter is based in Cupertino, California, and is a privately held open source company providing a Kubernetes management platform. The deal is expected to close before the end of October 2020, subject to customary closing conditions including receipt of regulatory approvals.

Melissa Di Donato, SUSE's CEO, said, "This is an incredible moment for our industry, as two open source leaders are joining forces. The merger of a leader in enterprise Linux, edge computing, and AI with a leader in enterprise Kubernetes management will disrupt the market to help customers accelerate their digital transformation journeys. Only the combination of SUSE and Rancher will have the depth of a globally supported and 100 per cent true open source portfolio, including cloud-native technologies, to help our customers seamlessly innovate across their business, from the edge to the core to the cloud."

The companies said that following regulatory approvals and the acquisition's close, customers of both companies will benefit from a broader portfolio as well as an increased global presence and innovation power. SUSE added that its customers will benefit from the robust capabilities of Rancher's cloud native technologies. Rancher's customers will gain access to SUSE's global support network and broad open source portfolio.

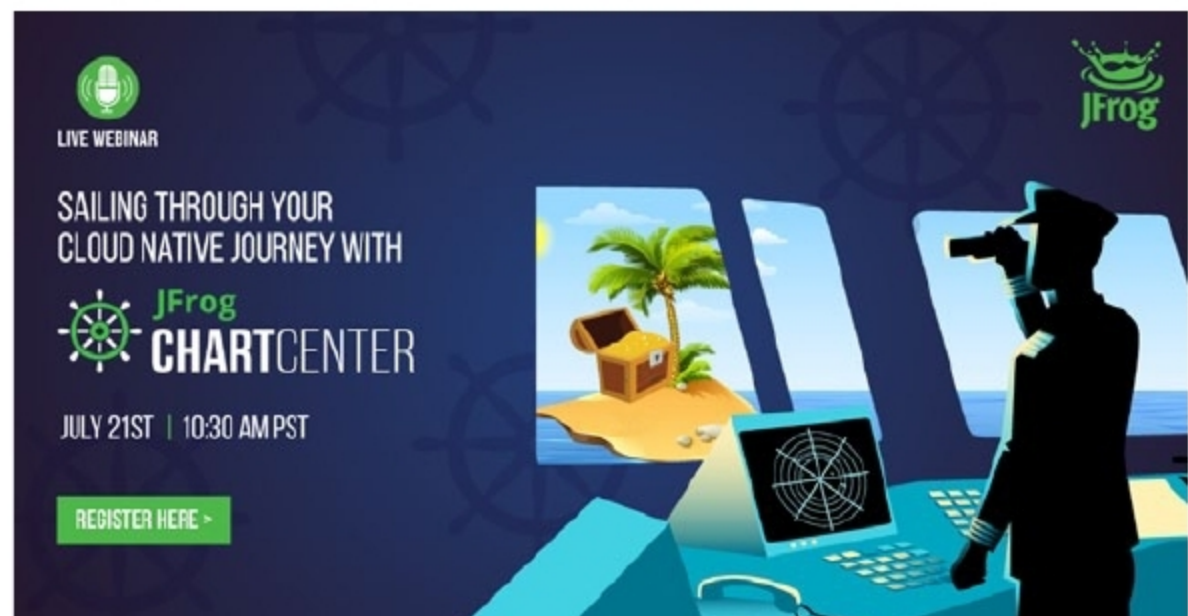

SUSE said that this acquisition is the first step in the company's growth strategy since becoming a fully independent software company in March 2019.

The SODA Foundation also announced the release of Faroe version 1.0 of its Open Data Framework software for cloud native and other applications. It said that Faroe eliminates data silos, delivers integrated data management, and enables seamless data mobility between on-premise and multi-cloud environments. It does so by providing support for block, file and object storage, multi-cloud data control, telemetry, and resource management across heterogeneous storage.

Mike Dolan, senior vice president and GM of projects at the Linux Foundation, said, "With data privacy and treatment at the top of every company's priority list, the SODA Foundation serves an important role across industries. With new membership commitments, from vendors and end users alike, and an expanded scope to integrate software and standards, we believe this community will have an incredible impact in the coming months and years."

JFrog launches ChartCenter, a central repository for Helm charts

JFrog has launched ChartCenter, supposedly the first free, security-focused central repository of Helm charts for the community. Company sources added that the ChartCenter repository will ensure that developers can easily access consistent versions of any publicly available Helm charts, which are currently stored in various locations across the Web and can be changed or removed at any time.

JFrog CTO and co-founder Yoav Landman said, "Helm plays a critical role in the fast-growing Kubernetes ecosystem, and it's important for developers to be able to access and share consistent and secure versions of Helm charts for their applications. We are creating a true unified and open repository that allows developers to set up a single trusted location to consume immutable charts from every chart creator, together with important security information and metadata attached to these charts."

Helm is an application package manager running atop Kubernetes. The company says that it simplifies the process of defining, storing, and managing applications through convenient Helm charts. With different Helm charts and versions traditionally stored on various sites across the Internet, it has been hard for developers to trust, locate, and learn about them all. It added that developers also risk losing access to a specific chart if the host removes it.

Project ACRN, an open source hypervisor for IoT development, releases ACRN v2.0

Project ACRN, an open source IoT hypervisor hosted at the Linux Foundation, has released ACRN v2.0, which expands the scope of the project. It also introduces a new, hybrid-mode architecture with a focus on Industrial IoT and edge device use
