

IIoT Gateway: The first of its kind open source distro to be made in India

Developed in Pune, the IIoT Gateway is open source, free and focuses on the Industrial and Internet of Things (IIoT) sector. The OS can be used to design, deploy, and develop applications for machine monitoring, data acquisition, and visualisation in core industry sectors like automotive and pharma.

It also has inbuilt application designing facilities in high level languages like Python, NodeJS, and Java.

« Harshad Joshi

IIoT Gateway is a 'Made in India' GNU/Linux distro consisting of a software package designed for Industrial Internet of Things (IIoT) and Internet of Things (IoT) applications.

It bridges the gap between IT (information technology) and OT (operational technology) by offering an easy-to-use Web UI for Modbus/OPCUA data acquisition, LTE connectivity, and MQTT communications, along with the capability to develop, host

and deploy applications according to user requirements.

Harshad Joshi, the inventor of this gateway, says, "All the code in this gateway is open source and training or consulting is available for end users if required. Base applications can be developed in the Python programming language, NodeJS, and the Java platform, as everything is preconfigured and preinstalled from start to end. IIoT Gateway is completely free for use and distribution with no limitations or

licensing required." This OS can be installed over a VM, an enterprise-grade server, or just your desktop. There are two people working on this gateway at present – Joshi's partner, who is an expert in PLC programming and systems integration, and Joshi himself, who works as a systems software designer. The duo plan to add more freelancers and independent vendors to the team for further growth, once the industry resumes normal functioning in the coming months.
