

Meet Server can be installed on-premise, which improves its scalability. Debian 10 Buster + and Ubuntu Bioinic Beaver 18+ are supported out-of-the-box. Jitisi Server can also be installed as a Docker container. Jitisi Meet client applications are available for the Web and all the operating systems like iOS and Android. Jitisi Meet is encrypted and you don't need an account to start or attend a meeting. It is easy to set up a call. You can create a password if needed and can invite your friends through its interface. You can switch to either the tile view or the call view, blur the background, etc. There is an option to raise your hand for chat. Jitisi Meet also offers desktop streaming, which is screen-sharing capabilities during calls, including the ability for a host to share YouTube videos with participants. Jitisi's support for screen recording needs a Dropbox account though, and you can share a YouTube video over Jitisi. Go to <https://meet.jit.si/> to start a video conference over Jitisi.

## E-learning: Moodle and OBS Studio

Training is part of every evolving workplace, and there are several free and open source software solutions to manage and create e-learning materials effectively.

Moodle is free and open source and the most popular e-learning platform. Moodle is based on pedagogical principles and can be used for distance education, blended learning and e-learning in schools, universities and workplaces. It has support for e-learning standards like SCORM and LTI. Its latest version is 3.9, and it has integrated options like H5p which can be used for creating interesting content like interactive videos.

OBS Studio is the popular free software tool for video recording and live streaming. This tool can be used to create videos with presentations, screen recording in the background and webcam recording of the speaker, on

the side. This is a very powerful tool for creating video presentations and lectures, and can be used for e-learning.

OBS Studio can do high-performance real-time video/audio capturing and mixing. It can be used to create scenes from multiple sources including window captures, images, text, browser windows, webcams, capture cards and more. It can set up an unlimited number of scenes that you can switch between seamlessly via custom transitions.

OBS Studio comes with an intuitive audio mixer with per-source filters such as a noise gate, noise suppression, and gain. It allows you to take full control with VST plugin support. The modular Dock UI allows you to rearrange the layout just as you like. You can even pop out each individual Dock to its own window.

## Peertube: Free and privacy friendly alternative to YouTube

Peertube is free and open source. It is a decentralised federated video platform powered by Activiti Pub and Webtorrent. The peer-to-peer technology used by Peertube helps to reduce load on the servers. This project was started by a programmer named Chocobozz in 2015 and is now supported by a French non-profit called Framasoft. Peertube is not a centralised platform but a network of interconnected small video hosts. You can host your own Peertube instance and upload your videos. Each instance can host its users and videos. Hence, Peertube is a federation of independent hosting services -- every instance is created, moderated and maintained independently by various administrators. Each Peertube server can host any number of videos by itself, and can additionally federate with other servers to let users watch their videos in the same user interface. More information about this video hosting platform is available at <https://joinpeertube.org/en/>. The free software community of India has recently hosted a Peertube instance <https://videos.fsci.in/>. Another Peertube instance is <https://vidcommons.org/>.

FediLab, P2Play and Thorium are Peertube clients for Android which are available through F-Droid, the free software and privacy-friendly replacement to Google Playstore.

## NextCloud and CozyDrive: GDPR-compliant replacements to Google Drive and other proprietary solutions

Like Google Drive, many other proprietary solutions do not have the required privacy/data protection. Free 8GB and 4GB options are available for NextCloud and CozyDrive. Data protection and privacy concerns are met effectively by both these services. NextCloud can be hosted on the office server by installing it. See <https://nextcloud.com/install/#instructions-server> for instructions. Or you can just simply sign up with a NextCloud provider for a free account. You can change the provider to suit your data storage needs, and you can choose free data options from 2GB to 8GB. NextCloud however keeps the user in control, and guarantees compliance with business and legal requirements. It offers the ultimate control to protect digital sovereignty for governments and provides the highest security for protected health information. It enables easy and efficient collaboration on large files. NextCloud also offers a calendar and video chat without data leaks.

## GitLab and GitHub: Online repositories

For programming and documentation, centralised repositories like GitLab or GitHub can be used for collaboration. These repositories have support for Markdown and reST as well. Integration for a DevOps model using Jenkins, Travis, etc, can be done with these repositories. Modern editors like Atom and VSCode have integrated support for accessing the Git repositories. GNU Emacs supports Git through its generic version front-end called VC or through *magit*. Plugins like *fugitive* are available for Vim, for
