

```
print (dataset)
d2=pd.melt(dataset, id_vars =['Age'],
value_vars =['Gender'])
print (d2)
d3=pd.melt(dataset, id_vars =['Died'],
value_vars =['Gender'])
print (d3)
```

As depicted in Figure 4, after melting, the data set can be used for machine learning tasks and data science based evaluations. In the process of melting, the mapping of age and gender is done separately, and the association of gender with death is presented. Using this approach, the large data set can be broken down for further implementations of data science and research tasks with controlled variables.

Scope of research and development

As the data sets of COVID-19 as well as other viruses are available in the public domain, these can be used

Melting: Age - Gender				Melting: Died - Gender			
	Age	variable	value		Died	variable	value
0	19	Gender	m	0	0	Gender	m
1	35	Gender	m	1	0	Gender	m
2	26	Gender	m	2	0	Gender	m
3	27	Gender	f	3	0	Gender	f
4	19	Gender	f	4	1	Gender	f
5	23	Gender	f	5	0	Gender	f
6	27	Gender	f	6	0	Gender	f
7	32	Gender	m	7	1	Gender	m
8	42	Gender	m	8	0	Gender	m
9	35	Gender	f	9	0	Gender	f
10	26	Gender	m	10	0	Gender	m
11	26	Gender	m	11	0	Gender	m

by data scientists and researchers to identify the root causes of the disease and make predictions about its spread or control. Such data sets can be

trained using machine learning and deep learning models for predictive mining and analysis, for the benefit of society. **END**

per benchmarking reports, and hence it is very helpful in adapting to cloud migration based solutions including the hybrid cloud and multi-cloud solutions. Since it provides containerised solutions with Docker and Kubernetes, it is more suitable for geo-distributed and high performance solutions for refactoring on-premise DBs to the cloud. In addition, it provides PostgreSQL capabilities and hence is suitable for licence optimisation in cloud adoption by migrating Oracle or MSSQL DBs to cloud based YugaByteDB. As per YugaByteDB documentation, it has partnered with Blitzz, which provides a quick tool to migrate DBs like Oracle, MongoDB, MySQL, DynamoDB and Cassandra to YugaByteDB with zero downtime. Blitzz supports YSQL and YCQL APIs to migrate to YugaByteDB.

You can start with YugaByteDB from its documentation page at <https://docs.yugabyte.com/>. **END**
