

JFrog launches new software distribution capabilities to handle bottlenecks

JFrog has unveiled new software distribution capabilities to address the growing problem of software distribution bottlenecks. It said that the CDN based and peer-to-peer software package distribution mechanisms will help companies to overcome the challenge of frequently delivering large volumes of artifacts to internal teams and external clients.

Company sources said that the peer-to-peer artifact download capability will help companies that need to distribute coordinated software updates for hundreds and thousands of connected machines that are updated in parallel but cannot sacrifice speed and security. It will break the artifact down into smaller pieces, and allow those pieces to be shared between peers on the same network. JFrog can accelerate download speeds by orders of magnitude and increase resilience by expanding beyond a single point of failure.

Shlomi Ben Haim, co-founder and CEO of JFrog, said, “DevOps in a digital-first economy demands the need for speed and security throughout the entire software release cycle all the way to the edge. We provided our community with the first purely hybrid, end-to-end DevOps and DevSecOps platform, and now we’re extending it all the way to EdgeOps.”

ADIs automatically deliver the availability, performance and capacity that applications need. They do so at a lowest cost, accelerating the deployment and innovation of applications. ADIs help application teams shorten development life cycles and run more applications in their choice of cloud.

Anthony Lye, senior vice president, and general manager of NetApp’s Public Cloud Services business unit, said, “Together, we are extending NetApp’s vision for helping customers unlock the best of the cloud. With Spot by NetApp, we will enable customers to get more out of their cloud investment to gain competitive advantage and accelerate their business’ success.”

The company claimed that customers can save up to 90 per cent of their compute and storage infrastructure expenses, which typically make up 70 per cent of total cloud spending, while maintaining SLAs and SLOs.

Accenture makes strategic investment in Synadia

Accenture has made a strategic investment, through Accenture Ventures, in Synadia Communications, the company behind the production-proven open source NATS.io project. Synadia provides a highly-scalable, secure communications technology for digital systems, services, and devices. The terms of the equity investment were not disclosed.

Tom Lounibos, managing director, Accenture Ventures, said, “Our investment in Synadia and the NATS.io ecosystem demonstrates Accenture Ventures’ commitment to discover and curate the next generation of technologies and entrepreneurs that will forever change how the world works, lives and plays. We believe that Synadia
