

offers our enterprise clients a foundational piece of data security and resilience needed for edge computing.”

Organisations require a secure, flexible, extensible and future-proof communications capability across cloud, on-premises, Web, mobile and IoT environments as edge computing expands at an unprecedented pace. Synadia said that it helps to cater to these needs with its differentiated Adaptive Edge Architecture.

Aiven launches Karapace, an alternative to Kafka REST and Schema Registry

Aiven has launched Karapace, an open source tool that will serve as a drop-in replacement for Confluent’s Kafka REST and Schema Registry.

Hannu Valtonen, chief product officer at Aiven, said, “We’re proud to announce the release of Karapace, which demonstrates our continued commitment to the Apache Kafka open source community. Karapace provides an additional tool that makes it easier to manage Kafka clusters at scale and further unlocks the full functionality of the Kafka ecosystem, whether users want to utilise Aiven services or not.”

The company said that with Karapace, customers can use the tool to store Kafka schemas in a central repository. They can access their version history, serialise and deserialise messages, interface RESTfully with Kafka clusters, and perform administrative tasks on their cluster, such as produce and consume messages.

Aiven had previously contributed a number of fixes and feature releases like PGHoard (a PostgreSQL backup daemon and restore tooling for cloud object storage).

Valtonen added, “The other founders and I have been ardent supporters of open source for the length of our careers, both philosophically and practically. When we started Aiven, we wanted to continue that support by baking it right into the DNA of the company while also committing resources to furthering the projects we benefit from and believe in.”

Linux Foundation plans to advance financial operations through best practices

The Linux Foundation plans to host the FinOps Foundation to advance the discipline of FinOps through best practices, education, and standards. The FinOps Foundation includes 1,500 individual members globally and represents more than 500 companies with more than US\$ 1 billion in revenue each. It said that FinOps increases the business value of the cloud by bringing together technology, business, and finance professionals with a new set of cultures, knowledge skills, and technical processes. It added that member companies include Atlassian,

Google launches Open Usage Commons for managing open source trademarks

Tech giant Google is establishing an independent industry body named Open Usage Commons to help open source developers manage their projects’ trademarks. It is doing this in collaboration with academic leaders, independent contributors, and SADA Systems. The aim of the Open Usage Commons is to help open source projects assert and manage their project’s identity through programs specific to trademark management and conformance testing.

Chris DiBona, director, open source at Google said in a blog post, “Understanding and managing trademarks is critical for the long-term sustainability of projects, particularly with the increasing number of enterprise products based on open source. Trademarks sit at the juncture of the rule of law and the philosophy of open source, a complicated space; for this reason, we consider it to be the next challenge for open source, one we want to help with.”

Google said that to get Open Usage Commons started, it has contributed initial funding, and the trademarks of Angular, Gerrit and Istio will be joining the Open

Usage Commons. Angular is a Web application framework for the mobile and desktop, Gerrit is a Web based team code-collaboration tool, and Istio is an open platform to connect, manage and secure microservices.
