resources directory would be a Product 1 directory and a Product 2 directory, which would hold our corresponding keyword files for Feature 1, Feature 2, and so on — that means a single page objects directory for each product.

The reason for this approach is that we could use one common keywords file for all of the different products.

So, for things like suite setup and suite tear-down, which includes things like opening up the browser, closing browsers and such, if we don't want to have to repeat those keywords for multiple products, we could have this one common keywords file that serves each of our multiple products. In *Results* we would have a Product 1
