

```
(base) ekta@git-demo$ echo "Hi I am a forgotten file" > forgotten_file.txt
(base) ekta@git-demo$ echo "add it in 2nd commit" >> forgotten_file.txt
(base) ekta@git-demo$ git add forgotten_file.txt
(base) ekta@git-demo$ git commit --amend
[master 8081780] Add file2. 2nd commit
Date: Thu May 7 19:21:07 2020 +0530
3 files changed, 5 insertions(+), 1 deletion(-)
create mode 100644 file_2.txt
create mode 100644 forgotten_file.txt
```

Figure 14: Demonstration of a Git commit amend

```
(base) ekta@git-demo$ git revert 8081780e17e527b99e4cb27707313629f564d43c
[master b6530fc] Revert "Add file2. 2nd commit"
3 files changed, 1 insertion(+), 5 deletions(-)
delete mode 100644 file_2.txt
delete mode 100644 forgotten_file.txt
```

Figure 15: Reverting a commit using *git revert*

message or simply close the editor, and the new file will now be included in the commit as shown in Figure 14.

Commits can be reverted with changes removed along with the commit using *git revert <commit-hash>*. This leaves a commit message in the history about reverting the commit. The flag

--no-commit with the command is to not leave a commit message in the history and simply delete the changes. It is advised to be careful as the changes get

lost when reverting the commit, which is shown in Figure 15.

Commits can be reverted with changes preserved. There are several ways of achieving that. The following two commands are examples of resetting the commit without losing the changes: *git reset <commit-hash>* or *git reset HEAD^*. Files in the staging area can be unstaged using *git reset HEAD <file>*.

So, in this part we introduced Git, looked closely at its overall workflow and discussed some basic commands to get started. In the next part of this article, we will discuss about the collaborative aspects of git, working with remote repository and how it facilitates open source contributions. **END** 🐧
