

FreedomFi launches open source 5G network appliance

FreedomFi, the open 5G startup that helps anyone to build their own private LTE or 5G network, has announced that the FreedomFi gateway has been made available in public beta.

Cellular LTE networks offer superior range, reliability and security over Wi-Fi, but have historically required proprietary hardware from incumbent network equipment manufacturers. This makes them too expensive to build and maintain if deployed at medium or small scale.

Boris Renski, co-founder and CEO at FreedomFi, said, “The biggest benefit of 5G is not faster speed, but efficiencies unlocked through software-centric architecture. Coupled with open source and cloud-native design principles, software-driven 5G networks will have an order-of-magnitude lower OPEX. Ultimately, it is not about streaming videos faster and doing VR in select hotspots, but about connecting the next billion people in emerging geographies or matching private 5G economics to that of Wi-Fi for the enterprise use cases.”

FreedomFi offers a couple of options for people to get started with open source private cellular through their website. The company pledges that all proceeds will be reinvested towards building open source software code as part of the Magma project. Sponsors contributing

US\$ 300 towards the project will receive a beta FreedomFi gateway and limited, free access to CBRS spectrum. Those contributing US\$ 1,000 will get support with a “network up” guarantee, which offers FreedomFi guidance over a series of Zoom sessions.

VNC managing director and board member Andrea Wörrlein, said, “VNC and ownCloud both follow a strict open source approach and clearly differentiate themselves from proprietary software and public cloud providers that do not comply with European data protection guidelines with their solutions and service portfolio. We anticipate considerable results from the cooperation and see ourselves in an excellent position in a dynamic market for communication and collaboration solutions, especially

with regard to the increasingly important aspect of high data security.”

The open source software ownCloud is a content collaboration solution for the secure storage, processing and synchronisation of data. It can be operated in its own data centre or in a private cloud. The ownCloud solution is GDPR-compliant.

Wipro announces the expansion of its IBM Hybrid Cloud Practice

Wipro Limited has announced its intention to expand its IBM Hybrid Cloud Practice. Supported by technical experts from both organisations, the practice is expected to help Wipro customers modernise their digital operations across hybrid cloud environments by leveraging IBM Cloud Paks, which is containerised software running on Red Hat OpenShift.

Wipro’s IBM Hybrid Cloud Practice unit will help customers innovate at scale by leveraging industry-ready Wipro solutions such as BoundaryLess Enterprise (BLE) and ModernizR. Both these solutions were built with IBM Cloud Paks on

Red Hat OpenShift and can run in any cloud environment, including the IBM public cloud.

ModernizR is a software based solution built with IBM Cloud Pak for Applications, a key technology in Wipro’s cloud migration and operations portfolio. The solution is designed to help enterprises move their legacy applications

to the cloud by leveraging artificial intelligence to mine and analyse customers’ legacy applications and data. The resulting insights can be used to assess risk and recommend a migration strategy that includes employing automation to help software developers re-engineer the application.

Bhanumurthy B.M., president and chief operating officer, Wipro Limited, said, “Wipro empowers customers across industries to re-imagine their cloud journey with its business-first strategy and industrialised solutions approach. We believe the future will be driven by hybrid cloud; hence, the expansion of IBM Hybrid Cloud Practice is intrinsic to our strategy. It will strengthen our relationship with IBM and help accelerate our clients’ transformation journey across hybrid cloud environments.”

Red Hat introduces an update to support hybrid cloud computing

Red Hat Inc. has announced Red Hat Enterprise Linux 8.3, the latest version of its enterprise Linux platform. Generally available in the coming weeks, Red Hat Enterprise Linux 8.3 fuses the stability required by IT operations teams with cloud-
