

native innovation, providing a more stable platform for next-generation enterprise applications. The latest enhancements to the platform bring new performance

profiles and automation, reinforced security capabilities and updated container tools.

According to Red Hat's Enterprise Open Source Report, 63 per cent of organisations surveyed have a hybrid cloud architecture today. Linux is often a linchpin in hybrid

cloud deployments, providing a common operating environment that spans from bare-metal servers to public cloud deployments. As the world's leading enterprise Linux platform, Red Hat Enterprise Linux 8.3 is designed to deliver an enterprise-ready, standardised platform for this next wave of computing, helping enterprises transform digitally while retaining existing data centre investments.

Septentrio announces open source software and hardware for its GPS/GNSS module receivers

Septentrio has announced two important open source resources for its GPS/GNSS module receivers. The first one is ROSaic, which is a ROS (Robot Operating System) driver for the mosaic-X5 module as well as other Septentrio GNSS receivers. The second project, mosaicHAT, is an open source hardware reference design combining mosaic-X5 with a Raspberry Pi single-board computer.

ROSaic driver operates on ROS, which is a widely used programming environment within the industry and academics, commonly used for integrating robot technology and developing advanced robotics and autonomous systems. ROS allows data from numerous sensors to be combined, allowing high levels of autonomy.

The mosaicHAT project facilitates accurate and reliable GNSS positioning for robotics

and automation on a hardware level. Many engineers today use Raspberry Pi for prototyping and initial integrations. The company said that mosaicHAT board is an easy way for integrators to get started with Septentrio's mosaic-X5 GNSS module.

Fluree open sources its entire Web3 data platform

Fluree is releasing its core source code under the AGPL open source licence. It said that developers can pull from and contribute to Fluree on GitHub. This will build a new Internet ecosystem that promotes data-centric security, traceability and global interoperability.

Fluree co-CEO Brain Platz said, "By open sourcing our technology, we reject the status quo practice of locking data up in proprietary format, and instead solidify our commitment to building best-in-class open source solutions to modern data management problems. We are offering enterprises a bridge from vendor lock-in towards a future of complete data ownership, portability and interoperability."

MindsDB announces integrations with PostgreSQL and MySQL

MindsDB, the open source AI layer for existing databases, has announced official integrations with open source relational databases PostgreSQL and MySQL. It said that these join a growing list of integrations with community-driven databases including MariaDB and Clickhouse, to bring the machine learning capabilities of MindsDB to over 55 per cent of open source databases.

MindsDB brings machine learning to those who work with data, to allow users to create and deploy ML models using standard SQL queries and increase the efficiency of AI projects. By using AI-tables, database users can apply machine learning models straight from their database and automatically generate predictions as simple as querying a table.

PostgreSQL is an open source object-relational database system with over 30 years of active community development. The database has a strong reputation for reliability, feature robustness, and performance. MySQL, owned by Oracle, is trusted by organisations such as Facebook, Google, and Adobe. Together, the two represent 45 per cent of the active open source database market.

MindsDB co-founder, Adam Carrigan, said, "Bringing machine learning resources to the open source database community is a huge part of our mission to democratise machine learning. Staying connected to this community has helped us identify the main challenges of users that know their data best and give them machine learning tools to help them solve those problems."
