

Figure 1: Orange GUI

Figure 2: Orange widgets

Orange is a visual programming software package released under GPL, focused on components for data visualisation, machine learning, data mining, and analysis of data. The developers of Orange at the University of Ljubljana in Slovenia built the core components in C++ with wrappers in Python, which are available on GitHub. Orange is available for Mac, Linux and Windows users.

On Linux it can be installed using the following command:

```
pip install orange3
```

Or, if you are using Python provided by the Anaconda distribution, you are almost ready to go. Add *conda-forge* to the list of channels you can install packages from (from *conda config --add channels conda-forge*), and run *conda install orange3*.

When we open Orange, it offers a very simple and easy to use GUI, as shown in Figure 1. This GUI is divided into three
