

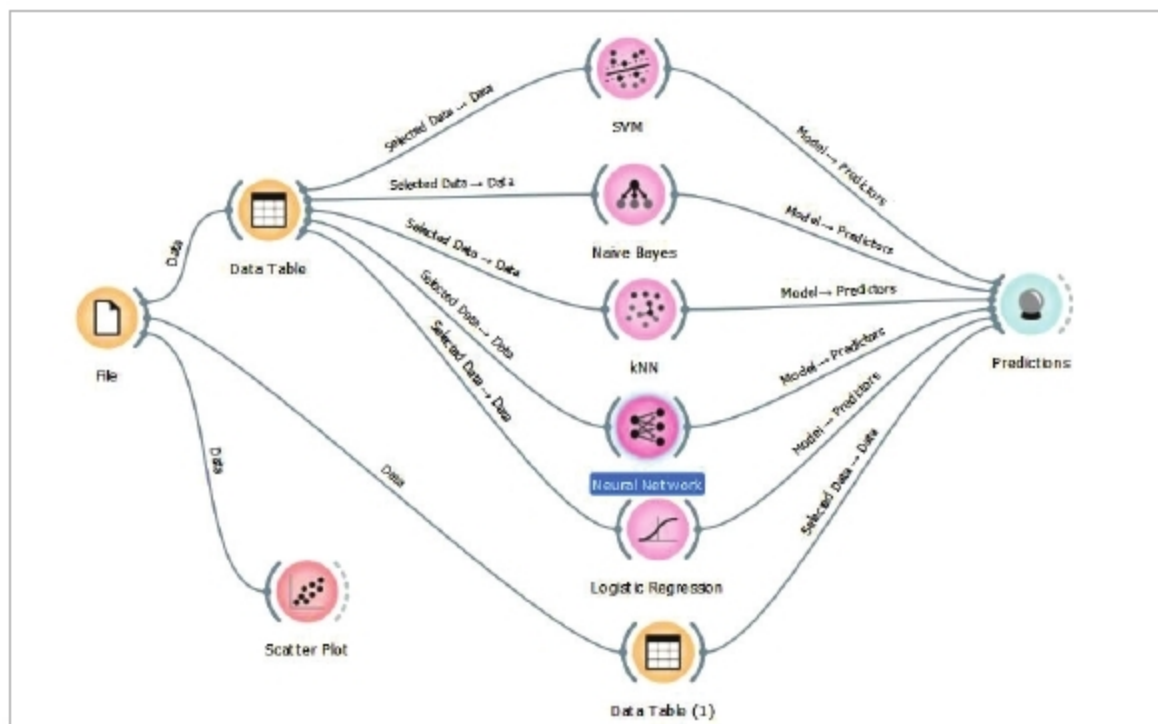

Figure 11: Applying different machine learning classifiers on the iris data set using Orange

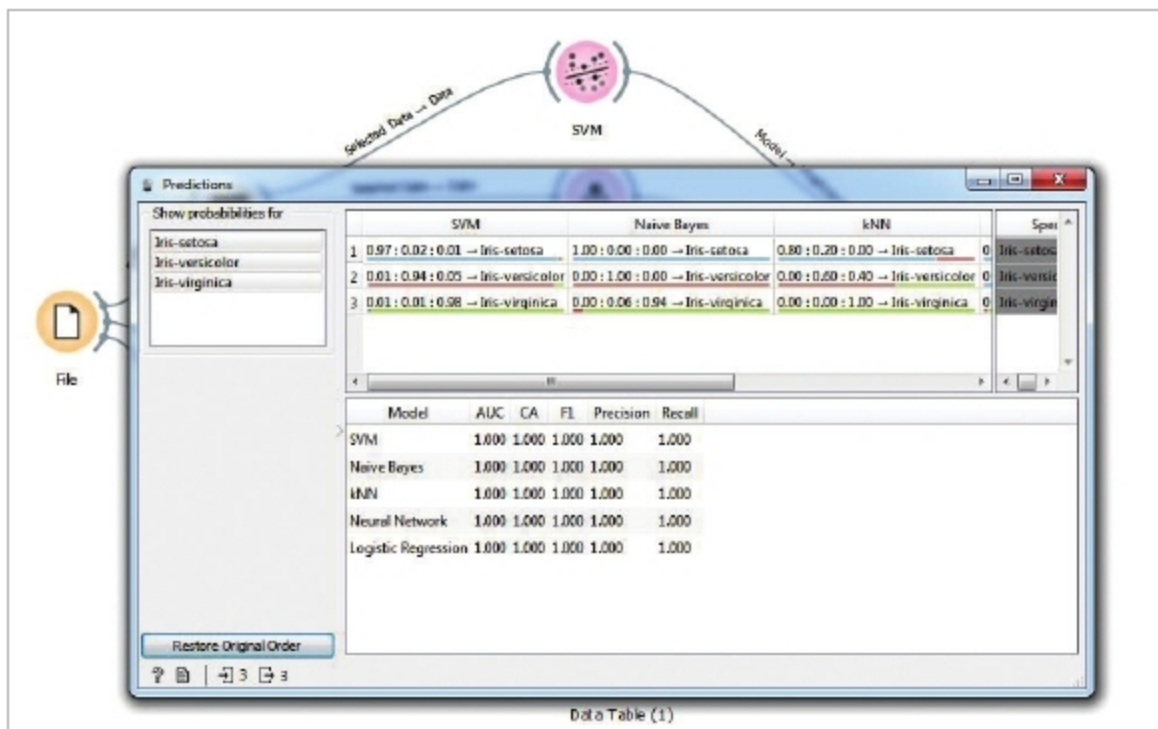

Figure 12: Different machine learning classifiers performance comparison

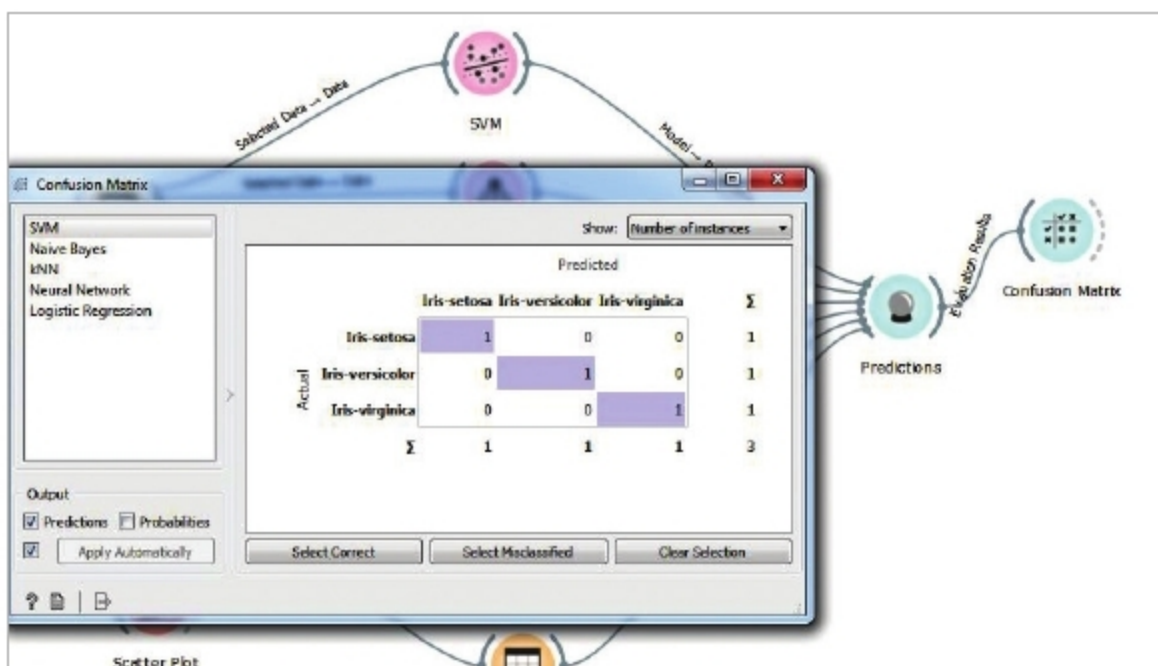

Figure 13: Confusion matrix for different machine learning classifiers – a performance analysis

output arc to the input arc of the *Predictions* widget, as shown in Figure 10. Click on the *Predictions* widget to check the classifier results, as shown in Figure 10. In the results, we check different parameters like classifier accuracy, F1 score, precision, recall, etc. Now connect other classifiers from the Model category, as shown in Figure 11, to make a comparative study (as shown in Figure 12). we can connect the confusion matrix widget from the Evaluate category to the *Predictions* widget, as shown in Figure 13.

Using the Orange tool you can easily apply different machine learning classifiers on the data set, and make a comparative study to find out the best classifier for the given data set without writing any line of code. Orange can be used for unsupervised learning, image analytics, time series analysis, mining, bioinformatics, etc. For more details, do visit the official documentation and tutorials listed under References below. **END** 🐧
