

BoxPlot, BarChart, GanttChart, Geo, Histogram, GLO (Graph-Level Operations), GeoDots, LineUp, LineChart, TreeHeatmap, OnSet, ScatterPlotMatrix, ScatterPlot, SentenTree, SimilarityGraph, and UpSet, using which easily understandable plots can be generated.

Charted

URL: <https://github.com/charted-co>

Charted is an open source tool that plots data on multiple axes and requirements as per the tasks associated with data analytics. This tool is very popular and is being used in data processing for high-performance data science projects. Charted currently supports multiple file formats, including comma separated values (CSVs) and tab separated values (TSVs), as many real-world data sets are in these formats.

D3.js

URL: <https://d3js.org/>

D3.js is a free and open source JavaScript library distribution that is used to manage data of multiple dimensions — even big data sets can be plotted. The library supports data visualisation through Web based standards, including HTML, SVG and CSS. The key goal of this platform is to provide the maximum capability of the current browser, including strong viewing components and an approach focused on the Document Object Model (DOM) without a proprietary system.

Datawrapper

URL: <https://www.datawrapper.de/>

Datawrapper is an open source data visualisation tool for anyone to create easy, realistic and embeddable charts quickly. This platform is available in both free and premium versions. The free version of Datawrapper is very powerful, and has a huge number of features.

Dygraphs

URL: <http://dygraphs.com/>

Dygraphs is a flexible and fast library

written in JavaScript and is friendly with assorted Web browsers. The charts and plots can be generated with a high resolution. On mouseover on the individual points of graphs, the values and data points can be analysed, which is useful for data analytics and knowledge discovery.

Leaflet

URL: <http://leafletjs.com/>

The Leaflet library is built to be quick, powerful, and user-friendly for data scientists and researchers. It runs easily across all major desktop and mobile platforms, and can be

expanded with several plugins. It has a powerful, easy-to-use, and well-documented API and easy-to-read source code so that advanced data science applications can be worked out. The Leaflet is an open source and collaborative charts library written in JavaScript. It is also very lightweight for the deployment of real-world applications, and operates effectively on computer, mobile and tablet devices. The APIs and functions of Leaflet are quite powerful and efficient for smart graphics and geometrical renderings with a modular architectural framework for high performance.
