

condition is true. For example, the script given below prints numbers from 1 to 10.

```
$ cat loop.sh
let i=1
while [ $i -le 10 ]
do
    echo -n "$i "
    let ++i # increment value of i by 1
done
```

The above script generates the following output when it is executed:

```
$ bash loop.sh
1 2 3 4 5 6 7 8 9 10
```

- c) *until* loop: This executes a set of commands as long as the conditional expression evaluates to false. For example, the script given below prints numbers from 1 to 10:

```
$ cat loop.sh
let i=1
until [ $i -gt 10 ]
do
```

```
    echo -n "$i "
    let ++i # increment value of i by 1
done
```

The script above generates the following output when it is executed:

```
$ bash loop.sh
1 2 3 4 5 6 7 8 9 10
```

- d) *select* loop: This provides an easy way to create a number menu for selection. For example, the script below creates a menu of the days in a week.

```
$ cat loop.sh
PS3="Select the day of the week: "
select day in Sun Mon Tue Wed Thu Fri Sat
do
    echo "$day selected"
done
```

This script generates the following

output when it is executed:

```
$ bash loop.sh
1) Sun
2) Mon
3) Tue
4) Wed
5) Thu
6) Fri
7) Sat
Select the day of the week: 1
Sun selected
Select the day of the week: 2
Mon selected
Select the day of the week: 3
Tue selected
Select the day of the week: ^C
```

So, we have seen how we can get started with the basic knowledge of scripting languages. There are many usages and applications of such scripts with shell. I leave it to your creativity to explore and try out scripting in different scenarios. **END** 🐧
