

WHO teams up with Red Hat to create open source infrastructure to assist healthcare workers

Red Hat, Inc. has announced it is working with the World Health Organization (WHO) to create sustainable open source development infrastructure. This will be used to support the development of the Learning Experience Platform (LXP) for the WHO Academy, the organisation's new state-of-the-art training centre.

Modern development practices from Red Hat Open Innovation Labs, Open Practice Library, and open source technologies from Red Hat community projects will be used to develop this infrastructure. WHO has built a scalable, more flexible DevOps platform to help with activities like managing and testing builds, analysing code, and data visualisation, to enable faster access to relevant healthcare knowledge and to reduce misinformation.

Hans Roth, senior vice president and general manager, Global Services, Red Hat, said, "The World Health Organisation has long led the way when it comes to creating innovative solutions for public health resources. It was an honour to work with the WHO on developing an open source platform that has the potential to shape how the world responds not only to the COVID crisis, but to future healthcare adversity. With the help of Red Hat Open Innovation Labs, the WHO broke down traditional IT barriers by replacing them with DevOps practices and solved challenges through collaboration, hard work and innovative thinking. Ultimately, the agency, along with Red Hat's support, has created a robust DevOps platform that can more efficiently provide knowledge to healthcare professionals around the world."

WHO said that its new DevOps platform addresses the ability to respond to current challenges like combating misinformation, and gaining additional skills to establish a new learning experience platform. WHO also sought to lay the groundwork for an open data model that can meet health workers' future needs, including offering more personalised learning experiences.

OpenBots launches a free and open source RPA suite

OpenBots Inc. has launched a completely free and open source process automation tool suite that provides discovery, development, and bot orchestration capabilities to all users through its RPA Studio, Server, and Discovery software. By some estimates, for every dollar spent on RPA software, almost three dollars are spent on implementation and services. OpenBots Studio and Server offer enterprises flexibility to scale their RPA automation programs without an exponential increase in licensing costs.

Ashish Nangla, CTO of OpenBots, comes from an extensive IT and automation background and is a renowned subject matter expert in user experience, AI, ML, RPA, and similar topics. He believes that the RPA market was a natural fit for an open source model since, unlike other enterprise software, most commercial RPA software requires extensive implementation, maintenance, and support services on top of licence costs.

All OpenBots tools are free and prioritise ease of use by developers and business users alike as per the company. While some automation tools claim to offer "free open source RPA" as well, orchestration and deployment of the processes built using their tool often come at a cost. The company said that it recognised this gap in the industry and created the first and only platform that offers free orchestration as well as development and other necessary functionalities.
