

LIXIL joins the Open Invention Network community

Open Invention Network (OIN) has announced that LIXIL Group Corporation (LIXIL) has become a licensee and joined more than 3,300 other OIN community members to promote open source innovation. It said that LIXIL is demonstrating its commitment to open source, especially embedded Linux, as it integrates Internet of Things (IoT) capabilities into its solutions.

Keith Bergelt, CEO of Open Invention Network, said, "The rapid adoption of IoT and digital technologies continues unabated. The proliferation of intelligence, propagated by the integration of open source, is enabling smarter kinds of water and housing products and services. LIXIL recognises the benefits of leveraging Linux and open source, enabling it to enhance its offerings. We are pleased LIXIL has joined our community and committed to patent non-aggression in Linux and adjacent open source technologies."

OIN's community practices patent non-aggression in core Linux and adjacent open source technologies. It does so by cross-licensing Linux system patents to one another on a royalty-free basis.

Yugo Kanazawa, chief digital officer at LIXIL, said, "Open source technologies, especially embedded Linux, have enabled the rapid development and deployment of intelligent products that can be found throughout the infrastructure of homes. LIXIL's participation in the OIN community shows our consistent commitment to open source innovation. We will continue to support shared innovation in open source and Linux."

The new LXP will be run entirely on Red Hat's open hybrid cloud technologies, offering WHO a scalable, flexible and more secure platform. Red Hat OpenShift provides the cloud-native foundation, a streamlined environment for building and deploying containerised applications and capabilities for assessing application metrics.

FINOS launches Open RegTech initiative

FINOS (the Fintech Open Source Foundation) has announced the launch of its Open RegTech initiative. It aims to expand the successful open collaboration model built between financial institutions, fintech and technology firms to regulators and regtech companies. It also announced a codebase contribution from Deutsche

Bank of the Symphony Java Toolkit as well as the OpenMAMA project, which is led by JPMorgan, Deutsche Bank and several other FINOS members.

Gabriele Columbro, executive director, FINOS, said, "When we started the foundation two years ago, we

couldn't have predicted such a groundswell of support from the financial services industry for our community and are extremely proud of what we've accomplished. This is just the beginning. By establishing an open source model for the regulatory community, building a strong project portfolio and adding active contributions from financial institutions, we have a unique opportunity to tackle other long-standing industry challenges."

Redis Labs makes Redis Enterprise on Microsoft Azure cache available in public preview

Redis Labs has announced that the new fully integrated tiers of Redis Enterprise on Microsoft Azure Cache for Redis have been made available in public preview. It said that the new Redis Enterprise tiers bring advanced functionality to Azure Cache, benefiting Azure based customers like BioCatch, who are already leveraging Redis Enterprise for improved developer productivity and enhanced operational resiliency with their applications.

Yiftach Shoolman, co-founder and CTO at Redis Labs, said, "The release of Redis Enterprise on Azure Cache on Redis gives developers an exciting preview of the applications they will be able to build using this service. Through our

joint development with Microsoft, we've created a truly unique, native managed service that will enable enterprises in building real-time applications over the Redis Enterprise tiers. We're most excited to already see our joint customers expand their Redis use cases through modules, achieving

better service-level agreements with Azure Multi-AZ deployments and extremely attractive total cost of ownership with Redis on Flash, and only expect this to grow among Azure developers in the public preview."

The new Redis modules include RediSearch that enables users to seamlessly index, query and search in their existing Redis data sets at the speed of Redis.
