

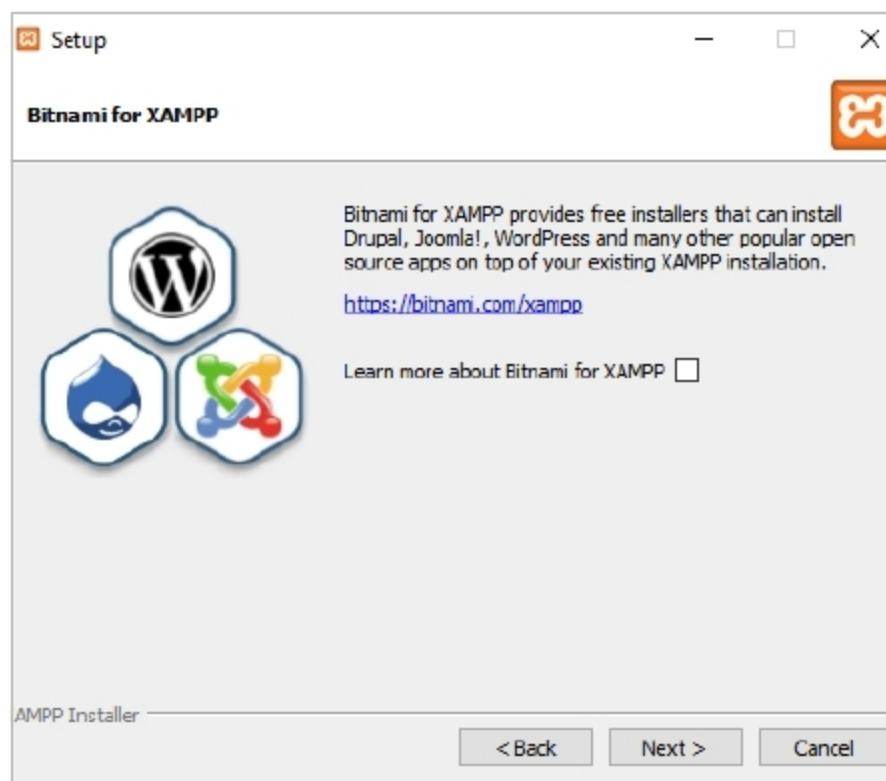

Figure 3: Choosing the Bitnami add-on

You will be prompted to install the Bitnami extension for WordPress, Joomla, Drupal, etc, along with your Xampp package. Check or uncheck the box as per your requirements. As can be seen in Figure 3, we have unchecked the box as the installation of Bitnami is irrelevant to this tutorial.

In the next couple of slides, you will have to select the location where you would like to install Xampp, and click on *Next* on a few others. Upon completion of the installation, select 'Launch Xampp' and click *Finish*.

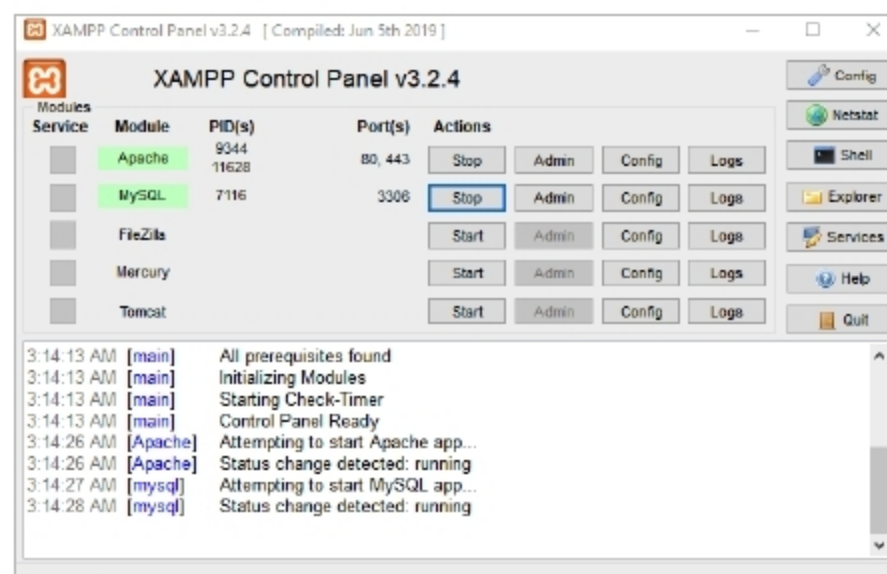

Figure 4: Running the Xampp control panel

Running Xampp

After successfully installing and running Xampp, you should see the Xampp control panel on your screen, as shown in Figure 4. Using this panel, you can start or stop services that are required for deploying and running your Web app. Click *Start* for Apache, which will serve as our local Web server, and for MySQL, which we will use as a database for our PHP Web app.

Now open your Web browser and type localhost or 127.0.0.1, which is the default IP address for the local Web server. If everything is in order, the page shown in Figure 5 should open up. What you are seeing is the default page of the Web application, which basically means that your local server is working perfectly.
