Deploying the PHP Web app to local server

Now we will get to the fun part, which is launching the very first 'Hello World' Web app using PHP. In order to do this, you need to locate the *htdocs* folder and upload your PHP code to that folder. Navigate to where you downloaded and installed Xampp. For most people, it is *C:/Xampp/* unless you have chosen a different destination directory during installation.

In the Xampp folder, locate the *htdocs* directory. You will see a bunch of pre-installed files and folders there. Select all the files and folders within the *htdocs* directory and delete them. Then create a single file named *index.php*. An index file in a Web app is a file that opens by default when the domain of the Web app is accessed. You can think of it as the home page or the landing page of your Web app.

Now, open the *index.php* file using any code editor of your choice. My personal preference is 'Sublime Text' but you can choose whatever you like. Once opened, write the code shown in Figure 6 and hit Save.

Now, if you refresh the localhost page on your Web browser, you should see a blank page with the 'Hello World' message, as shown in Figure 7. Congratulations, you have just deployed your first PHP Web app using Xampp!
