

Questionmark provides SUSE with one-stop-shop certification assessments

SUSE has partnered with Questionmark, the online assessment provider, to expand the reach and efficiency of its certification programmes. The SUSE certification programme enables technicians to qualify at 'administrator,' 'engineer' or 'architect' levels, giving customers confidence in their ability to deliver.

vice president
of SUSE
Global
Training

Services, said, "Organisations that invest in training and certifying their IT professionals increase business performance through happier customers, effective operations and lower maintenance costs. In addition, trained and certified IT professionals deliver better performance due to increased self-confidence and technology mastery. By delivering our assessments online with Questionmark, we can deliver tests in greater numbers and increase the scope of our certifications."

By working with Questionmark as its online assessment partner, SUSE says it will be able to offer greater flexibility with question types, ask assessment content more quickly, and create a secure exam environment with Questionmark's proctoring services.

Lars Pedersen, CEO of Questionmark, said, "In a world where technical solutions are constantly innovating, credentialing organisations need to release new assessments quickly. Our enterprise-grade assessment platform enables customers like SUSE to quickly adapt assessment content and deliver tests to an unlimited number of candidates in a secure online environment."

The company said that this amount of available capital allows the company to accelerate product development initiatives around AI and machine learning, expand headcount and propel go-to-market activities around the globe.

As companies accelerate their digital transformation initiatives to offset the impact of Covid-19, while building and deploying microservices and cloud native architectures to meet a growing demand for digital services, they face new complexities when trying to monitor these technologies at scale. The company said that its unified, open source observability platform for log, metrics and tracing analytics responds to these challenges, supporting and enabling digital transformation and other innovative new business initiatives by making production monitoring and troubleshooting faster, easier and more cost-effective.

Postman and AsyncAPI join hands for next generation of APIs

Postman has announced it is joining forces with AsyncAPI to develop the open source tools needed to build the next generation of APIs. With this, AsyncAPI gains new resources to continue evolving its specifications, while Postman taps into expertise around event-driven and message-driven APIs.

A spokesperson from Postman said, "Postman continued to increase its own adoption of—and commitment to—the OpenAPI Specification in 2020, positioning it as one possible source of truth for HTTP APIs that are developed on the Postman platform."

Postman is continuing this effort by increasing its support of AsyncAPI. The company said that AsyncAPI has grown rapidly while offering an array of open source tooling that complements OpenAPI. This will empower Postman's community of users to define and deliver APIs using a mix of protocols and patterns, while also being able to consistently document, mock, test, and deliver full life cycle API management services.

Abhinav Asthana, co-founder and CEO, Postman, said, "As an indispensable tool in the toolbox of API producers and consumers, it just makes sense for Postman to invest in a future where the API toolbox is not just defined by OpenAPI, Swagger, RAML, GraphQL, and SOAP using HTTP 1.1; Postman also wants to expand that toolbox to include TCP, HTTP/2, HTTP/3, MQTT, AMQP, and message- or event-driven APIs as well. We want to create a more complete toolbox, and AsyncAPI is a big part of that."
